# NCERT Solutions for Class 11 Chemistry Chapter 6

# **Thermodynamics Class 11**

Chapter 6 Thermodynamics Exercise Solutions

Exercise: Solutions of Questions on Page Number: 182

Q1:

Choose the correct answer. A thermodynamic state function is a quantity

(i) used to determine heat changes

Hence, alternative (ii) is correct.

- (ii) whose value is independent of path
- (iii) used to determine pressure volume work
- (iv) whose value depends on temperature only.

# Answer:

A thermodynamic state function is a quantity whose value is independent of a path. Functions like p, V, Tetc. depend only on the state of a system and not on the path.

Q2:

For the process to occur under adiabatic conditions, the correct condition is:

- (i)  $\Delta T = 0$
- (ii)  $\Delta p = 0$
- (iii) q = 0
- (iv) w=0

# Answer:

A system is said to be under adiabatic conditions if there is no exchange of heat between the system and its surroundings. Hence, under adiabatic conditions, q = 0.

Therefore, alternative (iii) is correct.

Q3:

The enthalpies of all elements in their standard states are:

- (i) unity
- (ii) zero

- (iii) < 0
- (iv) different for each element

# Answer:

The enthalpy of all elements in their standard state is zero.

Therefore, alternative (ii) is correct.

# Q4:

 $\Delta U^{\lambda \dot{z}\dot{A}}$  of combustion of methane is - XkJ mol<sup>-1</sup>. The value of  $\Delta H^{\dot{\lambda}\dot{z}\dot{A}}$  is

- (i) =  $\Delta U^{\tilde{A}\tilde{Z}\hat{A}_{,}}$
- (ii) >  $\Delta U^{\tilde{A}\check{Z}\hat{A},}$
- (iii)  $< \Delta U^{\tilde{A}\check{Z}\hat{A},}$
- (iv) = 0

#### Answer:

Since  $\Delta H^{\text{AZA}} = \Delta U^{\text{AZA}} + \Delta n_{\text{o}} R T$  and  $\Delta U^{\text{AZA}} = -XkJ \text{ mol}^{-1}$ ,

$$\Delta H^{\tilde{A}\tilde{Z}\hat{A}} = (-X) + \Delta n_a R T.$$

$$\Rightarrow \Delta H^{\tilde{A}\tilde{Z}\hat{A}_{,}} < \Delta U^{\tilde{A}\tilde{Z}\hat{A}_{,}}$$

Therefore, alternative (iii) is correct.

# Q5:

The enthalpy of combustion of methane, graphite and dihydrogen at 298 K are, -890.3 kJ mol<sup>-1</sup> -393.5 kJ mol<sup>-1</sup>, and -285.8 kJ mol<sup>-1</sup> respectively. Enthalpy of formation of  $CH_{4(g)}$  will be

- (i) -74.8 kJ mol<sup>-1</sup>
- (ii) -52.27 kJ mol
- (iii) +74.8 kJ mol<sup>-1</sup>
- (iv) +52.26 kJ mol-1.

### Answer:

According to the question,

(i) 
$$CH_{4(g)} + 2O_{2(g)} \longrightarrow CO_{2(g)} + 2H_2O_{(g)}$$

$$\Delta H = -890.3 \text{ kJ mol}^{-1}$$

(ii) 
$$C_{(s)} + O_{2(g)} \longrightarrow CO_{2(g)}$$

$$\Delta H = -393.5 \text{ kJ mol}^{-1}$$

(iii) 
$$2H_{2(g)} + O_{2(g)} \longrightarrow 2H_2O_{(g)}$$

$$\Delta H = -285.8 \text{ kJ mol}^{-1}$$

Thus, the desired equation is the one that represents the formation of CH4 (g) i.e.,

$$C_{(s)} + 2H_{2(g)} \longrightarrow CH_{4(g)}$$

$$\Delta_f H_{\text{CH}_4} = \Delta_c H_c + 2\Delta_c H_{\text{H}_7} - \Delta_c H_{\text{CO}_7}$$

$$= \left[ -393.5 + 2\left( -285.8 \right) - \left( -890.3 \right) \right] \text{ kJ mol}^{-1}$$

$$= -74.8 \text{ kJ mol}^{-1}$$

-- Enthalpy of formation of CH<sub>4(g)</sub> = â€"74.8 kJ mol<sup>å∈"1</sup>

Hence, alternative (i) is correct.

# Q6:

A reaction, A + B  $\rightarrow$  C + D + q is found to have a positive entropy change. The reaction will be

- (i) possible at high temperature
- (ii) possible only at low temperature
- (iii) not possible at any temperature
- (iv) possible at any temperature

#### Answer:

For a reaction to be spontaneous,  $\Delta G$ should be negative.

 $\Delta G = \Delta H - T\Delta S$ 

According to the question, for the given reaction,

 $\Delta S$ = positive

 $\Delta H$ = negative (since heat is evolved)

 $\Rightarrow \Delta G$ = negative

Therefore, the reaction is spontaneous at any temperature.

Hence, alternative (iv) is correct.

# Q7:

In a process, 701 J of heat is absorbed by a system and 394 J ofwork is done by the system. What is the change in internal energy for the process?

# Answer:

According to the first law of thermodynamics,

 $\Delta U = q + W(i)$ 

Where,

 $\Delta U$ = change in internal energy for a process

q= heat

W= work

Given,

q= +701 J (Since heat is absorbed)

W=-394 J (Since work is done by the system)

Substituting the values in expression (i), we get

 $\Delta U = 701 \text{ J} + (-394 \text{ J})$ 

 $\Delta U = 307 \text{ J}$ 

Hence, the change in internal energy for the given process is 307 J.

#### Q8:

The reaction of cyanamide, NH<sub>2</sub>CN<sub>(s)</sub> with dioxygen was carried out in a bomb calorimeter, and Δ*U* was found to be -742.7 kJ mol<sup>-1</sup>at 298 K. Calculate enthalpy change for the reaction at 298 K.

$$NH_2CN_{(s)} + \frac{3}{2}O_{2(g)} \rightarrow N_{2(g)} + CO_{2}(g) + H_2O_{(l)}$$

# Answer:

Enthalpy change for a reaction ( $\Delta H$ ) is given by the expression,

 $\Delta H = \Delta U + \Delta n_o R T$ 

Where,

 $\Delta U$  = change in internal energy

 $\Delta n_q$  = change in number of moles

For the given reaction,

 $\Delta n_g = \angle n_g$  (products) -  $\angle n_g$  (reactants)

= (2 - 1.5) moles

 $\Delta n_q = 0.5 \text{ moles}$ 

And,

 $\Delta U = -742.7 \text{ kJ mol}^{-1}$ 

T = 298 K

 $R = 8.314 \times 10^{-3} \text{ kJ mol}^{-1} \text{ K}^{-1}$ 

Substituting the values in the expression of  $\Delta H$ :

 $\Delta H = (-742.7 \text{ kJ mol}^{-1}) + (0.5 \text{ mol}) (298 \text{ K}) (8.314 \text{ x} 10^{-3} \text{ kJ mol}^{-1} \text{ K}^{-1})$ 

= -742.7 + 1.2

 $\Delta H = -741.5 \text{ kJ mol}^{-1}$ 

# Q9:

Calculate the number of kJ of heat necessary to raise the temperature of 60.0 g of aluminium from 35°C to 55°C. Molar heat capacity of Al is 24 J mol<sup>-1</sup> K<sup>-1</sup>.

### Answer:

From the expression of heat (q),

 $q = m. c. \Delta T$ 

Where,

c = molar heat capacity

m =mass of substance

 $\Delta T$  = change in temperature

Substituting the values in the expression of *q*:

$$q = \left(\frac{60}{27} \text{mol}\right) (24 \text{ J mol}^{-1} \text{ K}^{-1}) (20 \text{ K})$$

q = 1066.7 J

q = 1.07 kJ

#### Q10:

Calculate the enthalpy change on freezing of 1.0 mol of water at 10.0°C to ice at -10.0°C.  $\Delta_{fus}H = 6.03$  kJ mol at 0°C.

 $C_p[H_2O(I)] = 75.3 \text{ J mol}^{-1} \text{ K}^{-1}$ 

 $C_p[H_2O(s)] = 36.8 \text{ J mol}^{-1} \text{ K}^{-1}$ 

### Answer:

Total enthalpy change involved in the transformation is the sum of the following changes:

- (a) Energy change involved in the transformation of 1 mol of water at 10°C to 1 mol of water at 0°C.
- (b) Energy change involved in the transformation of 1 mol of water at 0° to 1 mol of ice at 0°C.
- (c) Energy change involved in the transformation of 1 mol of ice at 0°C to 1 mol of ice at â€"10°C.

Total 
$$\Delta \mathbf{H} = C_p \left[ \mathbf{H}_2 \mathbf{OCI} \right] \Delta T + \Delta H_{\text{freezing}} + C_p \left[ \mathbf{H}_2 \mathbf{O}_{(s)} \right] \Delta T$$

- = (75.3 J mol<sup>a∈1</sup> K<sup>a∈1</sup>) (0 â∈" 10)K + (â∈"6.03 × 10³ J mol<sup>a∈1</sup>) + (36.8 J mol<sup>a∈1</sup> K<sup>a∈1</sup>) (â∈"10 â∈" 0)K
- = â€"753 J mol<sup>â€"1</sup>â€" 6030 J mol<sup>â€"1</sup>â€" 368 J mol<sup>â€"1</sup>
- = –7151 J mol<sup>–1</sup>
- = â€"7.151 kJ mol<sup>â€"1</sup>

Hence, the enthalpy change involved in the transformation is â€"7.151 kJ mol<sup>â€"1</sup>.

#### Q11:

Enthalpy of combustion of carbon to CO₂is -393.5 kJ mol¹. Calculate the heat released upon formation of 35.2 g of CO<sub>2</sub> from carbon and dioxygen gas.

#### Answer:

Formation of CO<sub>2</sub> from carbon and dioxygen gas can be represented as:

$$C_{(s)} + O_{2(g)} \longrightarrow CO_{2(g)}$$
  $\Delta_f H = -393.5 \text{ kJ mol}^{-1}$ 

$$\Delta_f H = -393.5 \text{ kJ mol}$$

(1 mole = 44 g)

Heat released on formation of 44 g CO₂= â€"393.5 kJ mol<sup>a€1</sup>

Heat released on formation of 35.2 g CO<sub>2</sub>

$$= \frac{-393.5 \text{ kJ mol}^{-1}}{44 \text{ g}} \times 35.2 \text{ g}$$

= –314.8 kJ mol<sup>–1</sup>

# Q12:

Enthalpies of formation of CO<sub>(g)</sub>, CO<sub>2(g)</sub>, N<sub>2</sub>O<sub>(g)</sub> and N<sub>2</sub>O<sub>4(g)</sub> are â€"110 kJ mol<sup>a€"1</sup>, â€" 393 kJ mol<sup>a€"1</sup>, 81 kJ mol<sup>a€"1</sup> and 9.7 kJ mol<sup> $\delta\epsilon$ </sup> respectively. Find the value of  $\Delta_r H$  for the reaction:

$$N_2O_{4(g)} + 3CO_{(g)} \longrightarrow N_2O_{(g)} + 3CO_{2(g)}$$

# Answer:

 $\Delta H$  for a reaction is defined as the difference between  $\Delta H$  value of products and  $\Delta H$  value of reactants.

$$\Delta_r H = \sum \Delta_f H \text{ (products)} - \sum \Delta_f H \text{ (reactants)}$$

For the given reaction,

$$N_2O_{4(g)} + 3CO_{(g)} \longrightarrow N_2O_{(g)} + 3CO_{2(g)}$$

$$\Delta_r H = \left[ \left\{ \Delta_f H \left( N_2 O \right) + 3 \Delta_f H \left( C O_2 \right) \right\} - \left\{ \Delta_f H \left( N_2 O_4 \right) + 3 \Delta_f H \left( C O \right) \right\} \right]$$

Substituting the values of Δ<sub>1</sub>Hfor N<sub>2</sub>O, CO<sub>2</sub>, N<sub>2</sub>O<sub>4</sub>, and CO from the question, we get:

$$\Delta_{r}H = \left[ \left\{ 81 \text{ kJ mol}^{-1} + 3\left(-393\right) \text{kJ mol}^{-1} \right\} - \left\{ 9.7 \text{ kJ mol}^{-1} + 3\left(-110\right) \text{kJ mol}^{-1} \right\} \right]$$

$$\Delta_{r}H = -777.7 \text{ kJ mol}^{-1}$$

Hence, the value of  $\Delta_r H$  for the reaction is  $-777.7 \text{ kJ mol}^{-1}$ .

### Q13:

# Given

$$N_{2(g)} + 3H_{2(g)} \longrightarrow 2NH_{3(g)} \, ; \, \Delta_{\text{r}}\textit{H}\text{=} \, \hat{a}\text{\&``92.4 kJ mol}^{\text{a}\text{\'e}\text{``1}}$$

What is the standard enthalpy of formation of NH₃gas?

# Answer:

Standard enthalpy of formation of a compound is the change in enthalpy that takes place during the formation of 1 mole of a substance in its standard form from its constituent elements in their standard state.

Re-writing the given equation for 1 mole of NH<sub>3/g</sub>

$$\frac{1}{2} N_{2(g)} + \frac{3}{2} H_{2(g)} \longrightarrow NH_{3(g)}$$

Standard enthalpy of formation of NH<sub>3(g)</sub>

 $= \frac{1}{2} \Delta_r H^0$ 

= ½ (–92.4 kJ mol<sup>–1</sup>)

= –46.2 kJ mol<sup>å€</sup>"1

#### Q14:

Calculate the standard enthalpy of formation of  $\text{CH}_3\text{OH}_0$  from the following data:

$$\frac{3}{2} CH_{3}OH_{(f)} + \frac{3}{2} O_{2(g)} \longrightarrow CO_{2(g)} + 2H_{2}O_{(f)} ; \Delta_{r}H^{6} = \hat{a} \in "726 \text{ kJ mol}^{\hat{a} \in "1}$$

$$C_{(g)} + O_{2(g)} \longrightarrow CO_{2(g)} ; \Delta_{c}H^{6} = \hat{a} \in "393 \text{ kJ mol}^{\hat{a} \in "1}$$

$$H_{2(g)} +$$

# Answer:

The reaction that takes place during the formation of CH<sub>3</sub>OH<sub>0</sub>can be written as:

$$C_{(s)} + 2H_2O_{(g)} + \frac{1}{2}O_{2(g)} \longrightarrow CH_3OH_{(h)}(1)$$

The reaction (1) can be obtained from the given reactions by following the algebraic calculations as:

Equation (ii) + 2 × equation (iii) â€" equation (i)

$$\Delta_{f}H^{\theta}[CH_{3}OH_{(h)}] = \Delta_{c}H^{\theta} + 2\Delta_{f}H^{\theta}[H_{2}O_{(h)}] \hat{a} \in \Delta_{f}H^{\theta}$$

- = (–393 kJ mol<sup>â∈</sup>") + 2(–286 kJ mol<sup>â∈</sup>") (–726 kJ mol<sup>â∈</sup>")
- = (â€"393 â€" 572 + 726) kJ mol<sup>å∈</sup>1
- ... Δ<sub>t</sub>H<sup>0</sup>[CH<sub>3</sub>OH<sub>(h</sub>] = â€"239 kJ mol<sup>â€"1</sup>

### Q15:

Calculate the enthalpy change for the process

$$CCI_{4(g)} \rightarrow C_{(g)} + 4CI_{(g)}$$

and calculate bond enthalpy of C-CI in CCI<sub>4(g)</sub>.

$$\Delta_{vap}H^{\tilde{\Lambda}\tilde{Z}\hat{A}_{s}}$$
 (CCI<sub>4</sub>) = 30.5 kJ mol<sup>-1</sup>.

$$\Delta_t H^{\tilde{A}\tilde{Z}\hat{A}_s}$$
 (CCI<sub>4</sub>) = -135.5 kJ mol<sup>-1</sup>.

 $\Delta_a H^{\hat{a}\hat{z}\hat{A}}$  (C) = 715.0 kJ mol<sup>-1</sup>, where  $\Delta_a H^{\hat{a}\hat{z}\hat{A}}$  is enthalpy of atomisation

$$\Delta_a H^{\tilde{A}\tilde{Z}\hat{A}_s}$$
 (CI<sub>2</sub>) = 242 kJ mol<sup>-1</sup>

# Answer:

The chemical equations implying to the given values of enthalpies are:

(i) 
$$\operatorname{CCl}_{4(l)} \longrightarrow \operatorname{CCl}_{4(g)} \xrightarrow{\Delta_{vab}H^b} = 30.5 \text{ kJ mol}^{ac_1}$$

(ii) 
$$C_{(s)} \longrightarrow C_{(g)} \xrightarrow{\Delta_s H^s = 715.0 \text{ kJ mol}^{ac_1}}$$

(iii) 
$$\operatorname{Cl}_{2(g)} \longrightarrow 2\operatorname{Cl}_{(g)} \Delta_{a}H^{a} = 242 \text{ kJ mol}^{ac_1}$$

$$(\mathrm{iv}) \qquad \mathrm{C}_{(g)} + 4\mathrm{Cl}_{(g)} \longrightarrow \mathrm{CCl}_{4(g)} \underset{\Delta_{\ell}H \,=\, \hat{\mathbf{a}} \in \text{``135.5 kJ mol}^{\mathsf{a} \in \text{``1}} }{}$$

Enthalpy change for the given process algebraic calculations as:  $CCl_{4(g)} \longrightarrow C_{(g)} + 4Cl_{(g)}$ , can be calculated using the following

Equation (ii) + 2 × Equation (iii) â€" Equation (i) â€" Equation (iv)

$$\Delta H = \Delta_a H^0(C) + 2\Delta_a H^0(Cl_2) \hat{a} \in \Delta_{vap} H^0 \hat{a} \in \Delta_{rh} H^0$$

= (715.0 kJ mol<sup>a∈¹</sup>) + 2(242 kJ mol<sup>a∈¹</sup>) – (30.5 kJ mol<sup>a∈¹</sup>) – (–135.5 kJ mol<sup>a∈¹</sup>)

Bond enthalpy of Câ€"Cl bond in CCl4 (g)

$$=\frac{1304}{4} \text{ kJ mol}^{-1}$$

= 326 kJ mol<sup>å€"1</sup>

#### Q16:

For an isolated system,  $\Delta U = 0$ , what will be  $\Delta S$ ?

#### Answer:

 $\Delta S$  will be positive i.e., greater than zero

Since  $\Delta U = 0$ ,  $\Delta S$ will be positive and the reaction will be spontaneous.

# Q17:

For the reaction at 298 K,

$$2A + B \rightarrow C$$

 $\Delta H = 400 \text{ kJ mol}^{-1} \text{and } \Delta S = 0.2 \text{ kJ K}^{-1} \text{mol}^{-1}$ 

At what temperature will the reaction become spontaneous considering  $\Delta H$  and  $\Delta S$  to be constant over the temperature range?

#### Answer:

From the expression,

Assuming the reaction at equilibrium,  $\Delta T$  for the reaction would be:

$$T = \left(\Delta H - \Delta G\right) \frac{1}{\Delta S}$$

$$= \frac{\Delta H}{\Delta S}$$
 (\Delta G = 0 at equilibrium)

$$= \frac{400 \text{ kJ mol}^{-1}}{0.2 \text{ kJ K}^{-1} \text{ mol}^{-1}}$$

T = 2000 K

For the reaction to be spontaneous,  $\Delta G$ must be negative. Hence, for the given reaction to be spontaneous, Tshould be greater than 2000 K.

#### Q18:

For the reaction,

 $2Cl_{(g)} \rightarrow Cl_{2(g)}$ , what are the signs of  $\Delta H$  and  $\Delta S$ ?

# Answer:

 $\Delta H$ and  $\Delta S$  are negative

The given reaction represents the formation of chlorine molecule from chlorine atoms. Here, bond formation is taking place. Therefore, energy is being released. Hence,  $\Delta H$ is negative.

Also, two moles of atoms have more randomness than one mole of a molecule. Since spontaneity is decreased,  $\Delta S$  is negative for the given reaction.

# Q19:

For the reaction

$$2A_{(g)} + B_{(g)} \rightarrow 2D_{(g)}$$

 $\Delta U^{\text{AZA}} = -10.5 \text{ kJ}$  and  $\Delta S^{\text{AZA}} = -44.1 \text{ JK}^{-1}$ .

Calculate  $\Delta G^{\lambda \lambda}$  for the reaction, and predict whether the reaction may occur spontaneously.

#### Answer:

For the given reaction,

$$2 A_{(q)} + B_{(q)} \rightarrow 2D_{(q)}$$

$$\Delta n_q = 2 - (3)$$

Substituting the value of  $\Delta U^{\tilde{A}\tilde{Z}\tilde{A}_{,}}$  in the expression of  $\Delta H$ :

$$\Delta H^{\tilde{\Lambda}\tilde{Z}\hat{A}_{,}} = \Delta U^{\tilde{\Lambda}\tilde{Z}\hat{A}_{,}} + \Delta n_{a}RT$$

= 
$$(-10.5 \text{ kJ}) - (-1) (8.314 \times 10^{-3} \text{ kJ K}^{-1} \text{ mol}^{-1}) (298 \text{ K})$$

$$= -10.5 \text{ kJ} - 2.48 \text{ kJ}$$

$$\Delta H^{\tilde{A}\tilde{Z}\hat{A}_{3}} = -12.98 \text{ kJ}$$

Substituting the values of  $\Delta H^{\tilde{A}\tilde{Z}\tilde{A}_{,}}$  and  $\Delta S^{\tilde{A}\tilde{Z}\tilde{A}_{,}}$  in the expression of  $\Delta G^{\tilde{A}\tilde{Z}\tilde{A}_{,}}$ :

$$\Delta G^{\tilde{A}\tilde{Z}\hat{A}_{,}} = \Delta H^{\tilde{A}\tilde{Z}\hat{A}_{,}} - T\Delta S^{\tilde{A}\tilde{Z}\hat{A}_{,}}$$

$$= -12.98 \text{ kJ} - (298 \text{ K}) (-44.1 \text{ J K}^{-1})$$

$$= -12.98 \text{ kJ} + 13.14 \text{ kJ}$$

$$\Delta G^{\tilde{A}\tilde{Z}\hat{A}_{s}}$$
 = + 0.16 kJ

Since  $\Delta G^{A2A}$ , for the reaction is positive, the reaction will not occur spontaneously.

# Q20:

The equilibrium constant for a reaction is 10. What will be the value of  $\Delta G^{AZA}$ ? R = 8.314 JK-1mol-1, T= 300 K.

# Answer:

From the expression,

 $\Delta G^{\text{AZA}} = -2.303 \text{ R Tlog} K_{eq}$ 

 $\Delta G^{\tilde{A}\tilde{Z}\hat{A}}$ , for the reaction,

= (2.303)  $(8.314 \text{ JK}^{-1}\text{mol}^{-1})$  (300 K)  $\log 10$ 

= -5744.14 Jmol<sup>-1</sup>

= -5.744 kJ mol<sup>-1</sup>

#### Q21:

Comment on the thermodynamic stability of NO<sub>(g)</sub>,given

$$\frac{1}{2} \sum_{N_{2(g)} + \frac{1}{2}} \frac{1}{O_{2(g)}} \tilde{A} \phi \hat{a} \in NO_{(g)}; \Delta_{f} H^{g} = 90 \text{ kJ mol}^{\hat{a} \in 1}$$

$$NO_{(a)} + \frac{1}{2} O_{2(a)} \tilde{A} \phi \hat{a} \in NO_{2(a)} : \Delta H^{0} = \hat{a} \in 74 \text{ kJ mol}^{\hat{a} \in 74}$$

#### Answer:

The positive value of  $\Delta_r H$  indicates that heat is absorbed during the formation of  $NO_{(g)}$ . This means that  $NO_{(g)}$  has higher energy than the reactants ( $N_2$  and  $NO_{(g)}$ ). Hence,  $NO_{(g)}$  is unstable.

The negative value of  $\Delta_r H$  indicates that heat is evolved during the formation of  $NO_{2(g)}$  from  $NO_{(g)}$  and  $O_{2(g)}$ . The product,  $NO_{2(g)}$  is stabilized with minimum energy.

Hence, unstable NO<sub>(g)</sub> changes to stable NO<sub>2(g)</sub>.

#### Q22:

Calculate the entropy change in surroundings when 1.00 mol of  $H_2O_{(j)}$  is formed under standard conditions.  $\Delta_j H^{jk2A} = -286 \text{ kJ mol}^{-1}$ .

#### Answer:

It is given that 286 kJ mol<sup>3 $\epsilon$ 1</sup> of heat is evolved on the formation of 1 mol of H<sub>2</sub>O<sub>( $\delta$ )</sub>. Thus, an equal amount of heat will be absorbed by the surroundings.

 $q_{
m surr}$ 

Entropy change ( $\Delta S_{surr}$ ) for the surroundings =

$$= \frac{286 \text{ kJ mol}^{-1}}{298 \text{ k}}$$

••  $\Delta S_{sum}$ = 959.73 J mol<sup>ae-1</sup>K<sup>ae-1</sup>
