Exercise 5.1

Question 1:

Prove that the function f(x) = 5x - 3 is continuous at x = 0, at x = -3 and at x = 5. Answer

The given function is f(x) = 5x - 3At x = 0, $f(0) = 5 \times 0 - 3 = 3$ $\lim_{x \to 0} f(x) = \lim_{x \to 0} (5x - 3) = 5 \times 0 - 3 = -3$ $\therefore \lim_{x \to 0} f(x) = f(0)$

Therefore, f is continuous at x = 0

At x = -3, $f(-3) = 5 \times (-3) - 3 = -18$ $\lim_{x \to -3} f(x) = \lim_{x \to -3} (5x - 3) = 5 \times (-3) - 3 = -18$ $\therefore \lim_{x \to -3} f(x) = f(-3)$

Therefore, *f* is continuous at x = -3At x = 5, $f(x) = f(5) = 5 \times 5 - 3 = 25 - 3 = 22$ $\lim_{x \to 5} f(x) = \lim_{x \to 5} (5x - 3) = 5 \times 5 - 3 = 22$ $\therefore \lim_{x \to 5} f(x) = f(5)$

Therefore, f is continuous at x = 5

Question 2:

Examine the continuity of the function $f(x) = 2x^2 - 1$ at x = 3. Answer

The given function is $f(x) = 2x^2 - 1$ At x = 3, $f(x) = f(3) = 2 \times 3^2 - 1 = 17$ $\lim_{x \to 3} f(x) = \lim_{x \to 3} (2x^2 - 1) = 2 \times 3^2 - 1 = 17$ $\therefore \lim_{x \to 3} f(x) = f(3)$

Thus, f is continuous at x = 3

Question 3:

Examine the following functions for continuity.

(a)
$$f(x) = x - 5$$
 (b) $f(x) = \frac{1}{x - 5}, x \neq 5$
(c) $f(x) = \frac{x^2 - 25}{x + 5}, x \neq -5$ (d) $f(x) = |x - 5|$

Answer

(a) The given function is
$$f(x) = x - 5$$

It is evident that f is defined at every real number k and its value at k is k - 5.

It is also observed that,
$$\lim_{x \to k} f(x) = \lim_{x \to k} (x-5) = k-5 = f(k)$$

$$\therefore \lim_{x \to k} f(x) = f(k)$$

Hence, *f* is continuous at every real number and therefore, it is a continuous function.

(b) The given function is
$$f(x) = \frac{1}{x-5}, x \neq 5$$

For any real number $k \neq 5$, we obtain

$$\lim_{x \to k} f(x) = \lim_{x \to k} \frac{1}{x-5} = \frac{1}{k-5}$$

Also, $f(k) = \frac{1}{k-5}$ (As $k \neq 5$)
 $\therefore \lim_{x \to k} f(x) = f(k)$

Hence, f is continuous at every point in the domain of f and therefore, it is a continuous function.

$$f(x) = \frac{x^2 - 25}{x + 5}, x \neq -5$$

(c) The given function is

For any real number $c \neq -5$, we obtain

$$\lim_{x \to c} f(x) = \lim_{x \to c} \frac{x^2 - 25}{x + 5} = \lim_{x \to c} \frac{(x + 5)(x - 5)}{x + 5} = \lim_{x \to c} (x - 5) = (c - 5)$$

Also, $f(c) = \frac{(c + 5)(c - 5)}{c + 5} = (c - 5)$ (as $c \neq -5$)
 $\therefore \lim_{x \to c} f(x) = f(c)$

Hence, f is continuous at every point in the domain of f and therefore, it is a continuous function.

$$f(x) = |x-5| = \begin{cases} 5-x, \text{ if } x < 5\\ x-5, \text{ if } x \ge 5 \end{cases}$$

(d) The given function is

This function *f* is defined at all points of the real line.

Let c be a point on a real line. Then, c < 5 or c = 5 or c > 5

Case I: *c* < 5

Then,
$$f(c) = 5 - c$$

$$\lim_{x \to c} f(x) = \lim_{x \to c} (5 - x) = 5 - c$$

$$\therefore \lim_{x \to c} f(x) = f(c)$$

Therefore, *f* is continuous at all real numbers less than 5.

Case II :
$$c = 5$$

Then, $f(c) = f(5) = (5-5) = 0$
 $\lim_{x \to 5^{-}} f(x) = \lim_{x \to 5} (5-x) = (5-5) = 0$
 $\lim_{x \to 5^{+}} f(x) = \lim_{x \to 5} (x-5) = 0$
 $\therefore \lim_{x \to c^{-}} f(x) = \lim_{x \to c^{+}} f(x) = f(c)$
Therefore, f is continuous at $x = 5$
Case III: $c > 5$
Then, $f(c) = f(5) = c - 5$
 $\lim_{x \to c} f(x) = \lim_{x \to c} (x-5) = c - 5$

$$\therefore \lim_{x \to c} f(x) = f(c)$$

Therefore, *f* is continuous at all real numbers greater than 5.

Hence, *f* is continuous at every real number and therefore, it is a continuous function.

Question 4:

Prove that the function $f(x) = x^n$ is continuous at x = n, where *n* is a positive integer. Answer

The given function is $f(x) = x^n$

It is evident that f is defined at all positive integers, n, and its value at n is n^n .

Then,
$$\lim_{x \to n} f(n) = \lim_{x \to n} (x^n) = n^n$$

$$\therefore \lim_{x \to n} f(x) = f(n)$$

Therefore, f is continuous at n, where n is a positive integer.

Question 5:

Is the function *f* defined by

$$f(x) = \begin{cases} x, & \text{if } x \le 1\\ 5, & \text{if } x > 1 \end{cases}$$

continuous at x = 0? At x = 1? At x = 2?

Answer

$$f(x) = \begin{cases} x, & \text{if } x \le 1 \\ 5, & \text{if } x > 1 \end{cases}$$

At x = 0,

It is evident that f is defined at 0 and its value at 0 is 0.

Then,
$$\lim_{x \to 0} f(x) = \lim_{x \to 0} x = 0$$

The given function *f* is

$$\therefore \lim_{x \to 0} f(x) = f(0)$$

Therefore, f is continuous at x = 0

At
$$x = 1$$
,

f is defined at 1 and its value at 1 is 1.

The left hand limit of f at x = 1 is,

 $\lim_{x \to 1^-} f(x) = \lim_{x \to 1^-} x = 1$

The right hand limit of f at x = 1 is,

 $\lim_{x \to 1^{+}} f(x) = \lim_{x \to 1^{+}} (5) = 5$ $\therefore \lim_{x \to 1^{-}} f(x) \neq \lim_{x \to 1^{+}} f(x)$

Therefore, f is not continuous at x = 1

At x = 2,

f is defined at 2 and its value at 2 is 5.

Then,
$$\lim_{x \to 2} f(x) = \lim_{x \to 2} (5) = 5$$

$$\therefore \lim_{x \to 2} f(x) = f(2)$$

Therefore, *f* is continuous at x = 2

Question 6:

Find all points of discontinuity of *f*, where *f* is defined by

$$f(x) = \begin{cases} 2x+3, & \text{if } x \le 2\\ 2x-3, & \text{if } x > 2 \end{cases}$$

Answer

$$f(x) = \begin{cases} 2x+3, & \text{if } x \le 2\\ 2x-3, & \text{if } x > 2 \end{cases}$$

The given function *f* is

It is evident that the given function f is defined at all the points of the real line.

Let *c* be a point on the real line. Then, three cases arise.

(i)
$$c < 2$$

(ii) $c > 2$
(iii) $c = 2$
Case (i) $c < 2$
Then, $f(c) = 2c + 3$
 $\lim_{x \to c} f(x) = \lim_{x \to c} (2x + 3) = 2c + 3$
 $\therefore \lim_{x \to c} f(x) = f(c)$

Therefore, *f* is continuous at all points *x*, such that x < 2Case (ii) c > 2 Then, f(c) = 2c - 3 $\lim_{x \to c} f(x) = \lim_{x \to c} (2x - 3) = 2c - 3$ $\therefore \lim_{x \to c} f(x) = f(c)$

Therefore, *f* is continuous at all points *x*, such that x > 2Case (iii) c = 2Then, the left hand limit of *f* at x = 2 is, $\lim_{x \to 2^{-}} f(x) = \lim_{x \to 2^{-}} (2x+3) = 2 \times 2 + 3 = 7$

The right hand limit of f at x = 2 is,

 $\lim_{x \to 2^+} f(x) = \lim_{x \to 2^+} (2x - 3) = 2 \times 2 - 3 = 1$

It is observed that the left and right hand limit of f at x = 2 do not coincide.

Therefore, *f* is not continuous at x = 2

Hence, x = 2 is the only point of discontinuity of *f*.

Question 7:

Find all points of discontinuity of *f*, where *f* is defined by

$$f(x) = \begin{cases} |x| + 3, & \text{if } x \le -3 \\ -2x, & \text{if } -3 < x < 3 \\ 6x + 2, & \text{if } x \ge 3 \end{cases}$$

Answer

$$f(x) = \begin{cases} |x| + 3 = -x + 3, & \text{if } x \le -3 \\ -2x, & \text{if } -3 < x < 3 \\ 6x + 2, & \text{if } x \ge 3 \end{cases}$$

The given function *f* is

The given function f is defined at all the points of the real line. Let c be a point on the real line.

Case I:

If
$$c < -3$$
, then $f(c) = -c + 3$
 $\lim_{x \to c} f(x) = \lim_{x \to c} (-x + 3) = -c + 3$
 $\therefore \lim_{x \to c} f(x) = f(c)$

Therefore, *f* is continuous at all points *x*, such that x < -3 Case II:

If
$$c = -3$$
, then $f(-3) = -(-3) + 3 = 6$

$$\lim_{x \to -3^{-}} f(x) = \lim_{x \to -3^{-}} (-x+3) = -(-3) + 3 = 6$$

$$\lim_{x \to -3^{+}} f(x) = \lim_{x \to -3^{+}} (-2x) = -2 \times (-3) = 6$$

$$\therefore \lim_{x \to -3} f(x) = f(-3)$$

Therefore, *f* is continuous at x = -3Case III:

If -3 < c < 3, then f(c) = -2c and $\lim_{x \to c} f(x) = \lim_{x \to c} (-2x) = -2c$

 $\therefore \lim_{x \to c} f(x) = f(c)$

Therefore, f is continuous in (-3, 3).

Case IV:

If c = 3, then the left hand limit of f at x = 3 is,

$$\lim_{x \to 3^{-}} f(x) = \lim_{x \to 3^{-}} (-2x) = -2 \times 3 = -6$$

The right hand limit of f at x = 3 is,

$$\lim_{x \to 3^+} f(x) = \lim_{x \to 3^+} (6x + 2) = 6 \times 3 + 2 = 20$$

It is observed that the left and right hand limit of f at x = 3 do not coincide.

Therefore, *f* is not continuous at x = 3

Case V:

If c > 3, then f(c) = 6c + 2 and $\lim_{x \to c} f(x) = \lim_{x \to c} (6x + 2) = 6c + 2$ $\therefore \lim_{x \to c} f(x) = f(c)$

Therefore, *f* is continuous at all points *x*, such that x > 3Hence, x = 3 is the only point of discontinuity of *f*.

Question 8:

$$f(x) = \begin{cases} \frac{|x|}{x} & \text{if } x \neq 0\\ 0, & \text{if } x = 0 \end{cases}$$

$$f(x) = \begin{cases} \frac{|x|}{x} & \text{if } x \neq 0\\ 0, & \text{if } x = 0 \end{cases}$$

The given function *f* is

It is known that, $x < 0 \Longrightarrow |x| = -x$ and $x > 0 \Longrightarrow |x| = x$

Therefore, the given function can be rewritten as

$$f(x) = \begin{cases} \frac{|x|}{x} = \frac{-x}{x} = -1 \text{ if } x < 0\\ 0, \text{ if } x = 0\\ \frac{|x|}{x} = \frac{x}{x} = 1, \text{ if } x > 0 \end{cases}$$

The given function *f* is defined at all the points of the real line.

Let c be a point on the real line.

Case I:

If
$$c < 0$$
, then $f(c) = -1$
 $\lim_{x \to c} f(x) = \lim_{x \to c} (-1) = -1$

$$\therefore \lim_{x \to c} f(x) = f(c)$$

Therefore, *f* is continuous at all points x < 0

Case II:

If c = 0, then the left hand limit of f at x = 0 is,

$$\lim_{x \to 0^{-}} f(x) = \lim_{x \to 0^{-}} (-1) = -1$$

The right hand limit of f at x = 0 is,

$$\lim_{x \to 0^+} f(x) = \lim_{x \to 0^+} (1) = 1$$

It is observed that the left and right hand limit of f at x = 0 do not coincide.

Therefore, *f* is not continuous at x = 0

Case III:

If
$$c > 0$$
, then $f(c) = 1$

$$\lim_{x \to c} f(x) = \lim_{x \to c} (1) = 1$$

$$\therefore \lim_{x \to c} f(x) = f(c)$$

Therefore, *f* is continuous at all points *x*, such that x > 0Hence, x = 0 is the only point of discontinuity of *f*.

Question 9:

Find all points of discontinuity of *f*, where *f* is defined by

$$f(x) = \begin{cases} \frac{x}{|x|}, & \text{if } x < 0\\ -1, & \text{if } x \ge 0 \end{cases}$$

Answer

$$f(x) = \begin{cases} \frac{x}{|x|}, & \text{if } x < 0\\ -1, & \text{if } x \ge 0 \end{cases}$$

The given function *f* is

It is known that, $x < 0 \Rightarrow |x| = -x$

Therefore, the given function can be rewritten as

$$f(x) = \begin{cases} \frac{x}{|x|} = \frac{x}{-x} = -1, \text{ if } x < 0\\ -1, \text{ if } x \ge 0 \end{cases}$$
$$\Rightarrow f(x) = -1 \text{ for all } x \in \mathbf{R}$$

$$\lim_{x \to c} f(x) = \lim_{x \to c} (-1) = -1$$

Let c be any real number. Then, $f(c) = -1 = \lim_{x \to c} f(x)$

$$f(c) = -1 = \lim_{x \to x^-}$$

Therefore, the given function is a continuous function. Hence, the given function has no point of discontinuity.

Question 10:

$$f(x) = \begin{cases} x+1, \text{ if } x \ge 1\\ x^2+1, \text{ if } x < 1 \end{cases}$$

$$f(x) = \begin{cases} x+1, & \text{if } x \ge 1 \\ x^2+1, & \text{if } x < 1 \end{cases}$$

The given function f is

The given function f is defined at all the points of the real line.

Let *c* be a point on the real line.

Case I:

If
$$c < 1$$
, then $f(c) = c^2 + 1$ and $\lim_{x \to c} f(x) = \lim_{x \to c} (x^2 + 1) = c^2 + 1$
 $\therefore \lim_{x \to c} f(x) = f(c)$

Therefore, f is continuous at all points x, such that x < 1Case II:

If
$$c = 1$$
, then $f(c) = f(1) = 1 + 1 = 2$

The left hand limit of
$$f$$
 at $x = 1$ is,

$$\lim_{x \to 1^{-}} f(x) = \lim_{x \to 1^{-}} (x^{2} + 1) = 1^{2} + 1 = 2$$

The right hand limit of f at x = 1 is,

$$\lim_{x \to 1^{+}} f(x) = \lim_{x \to 1^{+}} (x+1) = 1+1 = 2$$

$$\therefore \lim_{x \to 1} f(x) = f(1)$$

Therefore, f is continuous at x = 1Case III:

If
$$c > 1$$
, then $f(c) = c + 1$

$$\lim_{x \to c} f(x) = \lim_{x \to c} (x+1) = c + 1$$

$$\therefore \lim_{x \to c} f(x) = f(c)$$

Therefore, *f* is continuous at all points *x*, such that x > 1Hence, the given function *f* has no point of discontinuity.

Question 11:

$$f(x) = \begin{cases} x^3 - 3, & \text{if } x \le 2\\ x^2 + 1, & \text{if } x > 2 \end{cases}$$

$$f(x) = \begin{cases} x^3 - 3, & \text{if } x \le 2\\ x^2 + 1, & \text{if } x > 2 \end{cases}$$

The given function *f* is

The given function f is defined at all the points of the real line.

Let *c* be a point on the real line.

Case I:

If
$$c < 2$$
, then $f(c) = c^3 - 3$ and $\lim_{x \to c} f(x) = \lim_{x \to c} (x^3 - 3) = c^3 - 3$

 $\therefore \lim_{x \to c} f(x) = f(c)$

Therefore, f is continuous at all points x, such that x < 2Case II:

If
$$c = 2$$
, then $f(c) = f(2) = 2^3 - 3 = 5$

$$\lim_{x \to 2^-} f(x) = \lim_{x \to 2^-} (x^3 - 3) = 2^3 - 3 = 5$$

$$\lim_{x \to 2^+} f(x) = \lim_{x \to 2^+} (x^2 + 1) = 2^2 + 1 = 5$$

$$\therefore \lim_{x \to 2} f(x) = f(2)$$

Therefore, f is continuous at x = 2Case III:

If
$$c > 2$$
, then $f(c) = c^2 + 1$
 $\lim_{x \to c} f(x) = \lim_{x \to c} (x^2 + 1) = c^2 + 1$
 $\therefore \lim_{x \to c} f(x) = f(c)$

Therefore, *f* is continuous at all points *x*, such that x > 2

Thus, the given function f is continuous at every point on the real line. Hence, f has no point of discontinuity.

Question 12:

$$f(x) = \begin{cases} x^{10} - 1, & \text{if } x \le 1 \\ x^2, & \text{if } x > 1 \end{cases}$$

$$f(x) = \begin{cases} x^{10} - 1, & \text{if } x \le 1 \\ x^2, & \text{if } x > 1 \end{cases}$$

The given function f is

The given function f is defined at all the points of the real line.

Let *c* be a point on the real line.

Case I:

If
$$c < 1$$
, then $f(c) = c^{10} - 1$ and $\lim_{x \to c} f(x) = \lim_{x \to c} (x^{10} - 1) = c^{10} - 1$
 $\therefore \lim_{x \to c} f(x) = f(c)$

Therefore, *f* is continuous at all points *x*, such that x < 1

Case II:

If c = 1, then the left hand limit of f at x = 1 is,

$$\lim_{x \to 1^{-}} f(x) = \lim_{x \to 1^{-}} (x^{10} - 1) = 1^{10} - 1 = 1 - 1 = 0$$

The right hand limit of f at x = 1 is,

$$\lim_{x \to 1^+} f(x) = \lim_{x \to 1^+} (x^2) = 1^2 = 1$$

It is observed that the left and right hand limit of f at x = 1 do not coincide.

Therefore,
$$f$$
 is not continuous at $x = 1$

Case III:

If
$$c > 1$$
, then $f(c) = c^2$

$$\lim_{x \to c} f(x) = \lim_{x \to c} (x^2) = c^2$$

$$\therefore \lim_{x \to c} f(x) = f(c)$$

Therefore, *f* is continuous at all points *x*, such that x > 1

Thus, from the above observation, it can be concluded that x = 1 is the only point of discontinuity of *f*.

Question 13: Is the function defined by

$$f(x) = \begin{cases} x+5, & \text{if } x \le 1\\ x-5, & \text{if } x > 1 \end{cases}$$

a continuous function?

Answer

$$f(x) = \begin{cases} x+5, & \text{if } x \le 1\\ x-5, & \text{if } x > 1 \end{cases}$$

The given function is

The given function f is defined at all the points of the real line.

Let *c* be a point on the real line.

Case I:

If
$$c < 1$$
, then $f(c) = c + 5$ and $\lim_{x \to c} f(x) = \lim_{x \to c} (x + 5) = c + 5$

$$\therefore \lim_{x \to c} f(x) = f(c)$$

Therefore, *f* is continuous at all points *x*, such that x < 1Case II:

If c = 1, then f(1) = 1 + 5 = 6

The left hand limit of f at x = 1 is,

$$\lim_{x \to 1^{-}} f(x) = \lim_{x \to 1^{-}} (x+5) = 1+5 = 6$$

The right hand limit of f at x = 1 is,

$$\lim_{x \to 1^+} f(x) = \lim_{x \to 1^+} (x - 5) = 1 - 5 = -4$$

It is observed that the left and right hand limit of f at x = 1 do not coincide.

Therefore, f is not continuous at x = 1

Case III:

If
$$c > 1$$
, then $f(c) = c - 5$ and $\lim_{x \to c} f(x) = \lim_{x \to c} (x - 5) = c - 5$

$$\therefore \lim_{x \to c} f(x) = f(c)$$

Therefore, *f* is continuous at all points *x*, such that x > 1

Thus, from the above observation, it can be concluded that x = 1 is the only point of discontinuity of *f*.

Question 14:

Discuss the continuity of the function f, where f is defined by

$$f(x) = \begin{cases} 3, & \text{if } 0 \le x \le 1 \\ 4, & \text{if } 1 < x < 3 \\ 5, & \text{if } 3 \le x \le 10 \end{cases}$$

Answer

$$f(x) = \begin{cases} 3, & \text{if } 0 \le x \le 1\\ 4, & \text{if } 1 < x < 3\\ 5, & \text{if } 3 \le x \le 10 \end{cases}$$

The given function is

The given function is defined at all points of the interval [0, 10].

Let c be a point in the interval [0, 10].

Case I:

If
$$0 \le c < 1$$
, then $f(c) = 3$ and $\lim_{x \to c} f(x) = \lim_{x \to c} (3) = 3$

$$\therefore \lim_{x \to c} f(x) = f(c)$$

Therefore, f is continuous in the interval [0, 1).

Case II:

If
$$c = 1$$
, then $f(3) = 3$

The left hand limit of f at x = 1 is,

$$\lim_{x \to 1^{-}} f(x) = \lim_{x \to 1^{-}} (3) = 3$$

The right hand limit of f at x = 1 is,

$$\lim_{x \to 1^+} f(x) = \lim_{x \to 1^+} (4) = 4$$

It is observed that the left and right hand limits of f at x = 1 do not coincide.

Therefore, f is not continuous at x = 1

Case III:

If
$$1 < c < 3$$
, then $f(c) = 4$ and $\lim_{x \to c} f(x) = \lim_{x \to c} (4) = 4$

$$\therefore \lim_{x \to c} f(x) = f(c)$$

Therefore, f is continuous at all points of the interval (1, 3). Case IV:

If c = 3, then f(c) = 5

The left hand limit of f at x = 3 is,

$$\lim_{x \to 3^{-}} f(x) = \lim_{x \to 3^{-}} (4) = 4$$

The right hand limit of f at x = 3 is,

$$\lim_{x \to 3^+} f(x) = \lim_{x \to 3^+} (5) = 5$$

It is observed that the left and right hand limits of f at x = 3 do not coincide.

Therefore, f is not continuous at x = 3

Case V:

If
$$3 < c \le 10$$
, then $f(c) = 5$ and $\lim_{x \to c} f(x) = \lim_{x \to c} (5) = 5$

 $\lim_{x \to c} f(x) = f(c)$

Therefore, *f* is continuous at all points of the interval (3, 10]. Hence, *f* is not continuous at x = 1 and x = 3

Question 15:

Discuss the continuity of the function *f*, where *f* is defined by

$$f(x) = \begin{cases} 2x, & \text{if } x < 0\\ 0, & \text{if } 0 \le x \le 1\\ 4x, & \text{if } x > 1 \end{cases}$$

Answer

$$f(x) = \begin{cases} 2x, & \text{if } x < 0\\ 0, & \text{if } 0 \le x \le 1\\ 4x, & \text{if } x > 1 \end{cases}$$

The given function is

The given function is defined at all points of the real line.

Let *c* be a point on the real line.

Case I:

If
$$c < 0$$
, then $f(c) = 2c$
lim $f(x) = \lim (2x) = 2c$

$$\lim_{x \to c} f(x) = f(c)$$

$$\lim_{x \to c} f(x) = f(c)$$

Therefore, *f* is continuous at all points *x*, such that x < 0

Case II:

If c = 0, then f(c) = f(0) = 0

The left hand limit of f at x = 0 is,

$$\lim_{x \to 0^{-}} f(x) = \lim_{x \to 0^{-}} (2x) = 2 \times 0 = 0$$

The right hand limit of f at x = 0 is,

$$\lim_{x \to 0^+} f(x) = \lim_{x \to 0^+} (0) = 0$$

$$\therefore \lim_{x \to 0} f(x) = f(0)$$

Therefore, f is continuous at x = 0

Case III:

If
$$0 < c < 1$$
, then $f(x) = 0$ and $\lim_{x \to c} f(x) = \lim_{x \to c} (0) = 0$
 $\therefore \lim_{x \to c} f(x) = f(c)$

Therefore, f is continuous at all points of the interval (0, 1). Case IV:

If
$$c = 1$$
, then $f(c) = f(1) = 0$

The left hand limit of f at x = 1 is,

$$\lim_{x \to 1^{-}} f(x) = \lim_{x \to 1^{-}} (0) = 0$$

The right hand limit of f at x = 1 is,

$$\lim_{x \to 1^{+}} f(x) = \lim_{x \to 1^{+}} (4x) = 4 \times 1 = 4$$

It is observed that the left and right hand limits of f at x = 1 do not coincide.

Therefore, f is not continuous at x = 1

Case V:

If
$$c < 1$$
, then $f(c) = 4c$ and $\lim_{x \to c} f(x) = \lim_{x \to c} (4x) = 4c$

$$\therefore \lim_{x \to c} f(x) = f(c)$$

Therefore, *f* is continuous at all points *x*, such that x > 1Hence, *f* is not continuous only at x = 1

Question 16:

Discuss the continuity of the function *f*, where *f* is defined by

$$f(x) = \begin{cases} -2, & \text{if } x \le -1 \\ 2x, & \text{if } -1 < x \le 1 \\ 2, & \text{if } x > 1 \end{cases}$$

$$f(x) = \begin{cases} -2, & \text{if } x \le -1 \\ 2x, & \text{if } -1 < x \le 1 \\ 2, & \text{if } x > 1 \end{cases}$$

The given function *f* is

The given function is defined at all points of the real line.

Let *c* be a point on the real line.

Case I:

If
$$c < -1$$
, then $f(c) = -2$ and $\lim_{x \to c} f(x) = \lim_{x \to c} (-2) = -2$
 $\therefore \lim_{x \to c} f(x) = f(c)$

Therefore, *f* is continuous at all points *x*, such that x < -1Case II:

If
$$c = -1$$
, then $f(c) = f(-1) = -2$

The left hand limit of f at x = -1 is,

$$\lim_{x \to -1^{-}} f(x) = \lim_{x \to -1^{-}} (-2) = -2$$

The right hand limit of f at x = -1 is,

$$\lim_{x \to -1^+} f(x) = \lim_{x \to -1^+} (2x) = 2 \times (-1) = -2$$

$$\therefore \lim_{x \to -1} f(x) = f(-1)$$

Therefore, f is continuous at x = -1Case III:

If
$$-1 < c < 1$$
, then $f(c) = 2c$

$$\lim_{x \to c} f(x) = \lim_{x \to c} (2x) = 2c$$

$$\therefore \lim_{x \to c} f(x) = f(c)$$

Therefore, f is continuous at all points of the interval (-1, 1). Case IV: If c = 1, then $f(c) = f(1) = 2 \times 1 = 2$

The left hand limit of f at x = 1 is,

$$\lim_{x \to 1^{-}} f(x) = \lim_{x \to 1^{-}} (2x) = 2 \times 1 = 2$$

The right hand limit of f at x = 1 is,

$$\lim_{x \to 1^+} f(x) = \lim_{x \to 1^+} 2 = 2$$
$$\therefore \lim_{x \to 1} f(x) = f(c)$$

Therefore, *f* is continuous at x = 2

Case V:

If c > 1, then f(c) = 2 and $\lim_{x \to c} f(x) = \lim_{x \to c} (2) = 2$

 $\lim_{x \to c} f(x) = f(c)$

Therefore, *f* is continuous at all points *x*, such that x > 1

Thus, from the above observations, it can be concluded that f is continuous at all points of the real line.

Question 17:

Find the relationship between a and b so that the function f defined by

$$f(x) = \begin{cases} ax+1, & \text{if } x \le 3\\ bx+3, & \text{if } x > 3 \end{cases}$$

is continuous at x = 3.

Answer

$$f(x) = \begin{cases} ax+1, & \text{if } x \le 3\\ bx+3, & \text{if } x > 3 \end{cases}$$

The given function f is

If *f* is continuous at x = 3, then

$$\lim_{x \to 3^{-}} f(x) = \lim_{x \to 3^{+}} f(x) = f(3) \qquad \dots(1)$$

Also,
$$\lim_{x \to 3^{-}} f(x) = \lim_{x \to 3^{+}} (ax+1) = 3a+1$$

$$\lim_{x \to 3^{+}} f(x) = \lim_{x \to 3^{+}} (bx+3) = 3b+3$$

 $f(3) = 3a+1$

Therefore, from (1), we obtain 3a+1=3b+3=3a+1 \Rightarrow 3a + 1 = 3b + 3 $\Rightarrow 3a = 3b + 2$ $\Rightarrow a = b + \frac{2}{3}$

Therefore, the required relationship is given by,
$$a = b + \frac{2}{3}$$

Question 18:

For what value of ${}^{\lambda}$ is the function defined by

$$f(x) = \begin{cases} \lambda (x^2 - 2x), & \text{if } x \le 0\\ 4x + 1, & \text{if } x > 0 \end{cases}$$

continuous at x = 0? What about continuity at x = 1? Answer

$$f(x) = \begin{cases} \lambda \left(x^2 - 2x \right), & \text{if } x \le 0 \\ 4x + 1, & \text{if } x > 0 \end{cases}$$

If f is continuous at x = 0, then

The given function *f* is

$$\lim_{x \to 0^{-}} f(x) = \lim_{x \to 0^{+}} f(x) = f(0)$$

$$\Rightarrow \lim_{x \to 0^{-}} \lambda \left(x^{2} - 2x \right) = \lim_{x \to 0^{+}} (4x + 1) = \lambda \left(0^{2} - 2 \times 0 \right)$$

$$\Rightarrow \lambda \left(0^{2} - 2 \times 0 \right) = 4 \times 0 + 1 = 0$$

$$\Rightarrow 0 = 1 = 0, \text{ which is not possible}$$

Therefore, there is no value of λ for which *f* is continuous at x = 0

At x = 1, $f(1) = 4x + 1 = 4 \times 1 + 1 = 5$ $\lim_{x \to 1} (4x+1) = 4 \times 1 + 1 = 5$ $\therefore \lim_{x \to 1} f(x) = f(1)$

Therefore, for any values of λ , *f* is continuous at x = 1

Question 19:

Show that the function defined by g(x) = x - [x] is discontinuous at all integral point.

Here $\begin{bmatrix} x \end{bmatrix}$ denotes the greatest integer less than or equal to x.

Answer

The given function is g(x) = x - [x]

It is evident that *g* is defined at all integral points.

Let n be an integer.

Then,

$$g(n) = n - [n] = n - n = 0$$

The left hand limit of f at x = n is,

$$\lim_{x \to n^{-}} g(x) = \lim_{x \to n^{-}} (x - [x]) = \lim_{x \to n^{-}} (x) - \lim_{x \to n^{-}} [x] = n - (n - 1) = 1$$

The right hand limit of f at x = n is,

$$\lim_{x \to n^+} g(x) = \lim_{x \to n^+} (x - [x]) = \lim_{x \to n^+} (x) - \lim_{x \to n^+} [x] = n - n = 0$$

It is observed that the left and right hand limits of f at x = n do not coincide.

Therefore, *f* is not continuous at x = n

Hence, g is discontinuous at all integral points.

Question 20:

Is the function defined by $f(x) = x^2 - \sin x + 5$ continuous at x = p? Answer

The given function is $f(x) = x^2 - \sin x + 5$

It is evident that f is defined at x = pAt $x = \pi$, $f(x) = f(\pi) = \pi^2 - \sin \pi + 5 = \pi^2 - 0 + 5 = \pi^2 + 5$ Consider $\lim_{x \to \pi} f(x) = \lim_{x \to \pi} (x^2 - \sin x + 5)$ Put $x = \pi + h$ If $x \to \pi$, then it is evident that $h \to 0$ $\therefore \lim_{x \to \pi} f(x) = \lim_{x \to \pi} (x^2 - \sin x + 5)$ $= \lim_{h \to 0} [(\pi + h)^2 - \sin(\pi + h) + 5]$ $= \lim_{h \to 0} (\pi + h)^2 - \lim_{h \to 0} \sin(\pi + h) + \lim_{h \to 0} 5$ $= (\pi + 0)^2 - \lim_{h \to 0} [\sin \pi \cosh + \cos \pi \sinh] + 5$ $= \pi^2 - \lim_{h \to 0} \sin \pi \cosh - \lim_{h \to 0} \cos \pi \sinh + 5$ $= \pi^2 - 0 \times 1 - (-1) \times 0 + 5$ $= \pi^2 + 5$ $\therefore \lim_{x \to \pi} f(x) = f(\pi)$

Therefore, the given function *f* is continuous at $x = \pi$

Question 21:

Discuss the continuity of the following functions.

(a) $f(x) = \sin x + \cos x$ (b) $f(x) = \sin x - \cos x$ (c) $f(x) = \sin x \times \cos x$ Answer

It is known that if g and h are two continuous functions, then

g+h, g-h, and g.h are also continuous.

It has to proved first that $g(x) = \sin x$ and $h(x) = \cos x$ are continuous functions.

Let
$$g(x) = \sin x$$

It is evident that $g(x) = \sin x$ is defined for every real number.

Let c be a real number. Put x = c + h

If $x \to c$, then $h \to 0$

$$g(c) = \sin c$$

$$\lim_{x \to c} g(x) = \lim_{x \to c} \sin x$$

$$= \lim_{h \to 0} \sin (c+h)$$

$$= \lim_{h \to 0} [\sin c \cos h + \cos c \sin h]$$

$$= \lim_{h \to 0} (\sin c \cos h) + \lim_{h \to 0} (\cos c \sin h)$$

$$= \sin c \cos 0 + \cos c \sin 0$$

$$= \sin c + 0$$

$$= \sin c$$

$$\therefore \lim_{x \to c} g(x) = g(c)$$

Therefore, g is a continuous function.

Let
$$h(x) = \cos x$$

It is evident that $h(x) = \cos x$ is defined for every real number.
Let c be a real number. Put $x = c + h$
If $x \to c$, then $h \to 0$
 $h(c) = \cos c$
 $\lim_{x \to c} h(x) = \lim_{x \to c} \cos x$
 $= \lim_{h \to 0} \cos(c + h)$
 $= \lim_{h \to 0} [\cos c \cos h - \sin c \sin h]$
 $= \lim_{h \to 0} \cos c \cos h - \lim_{h \to 0} \sin c \sin h$
 $= \cos c \cos 0 - \sin c \sin 0$
 $= \cos c \times 1 - \sin c \times 0$
 $= \cos c$
 $\therefore \lim_{x \to c} h(x) = h(c)$

Therefore, h is a continuous function.

Therefore, it can be concluded that

(a) $f(x) = g(x) + h(x) = \sin x + \cos x$ is a continuous function

- (b) $f(x) = g(x) h(x) = \sin x \cos x$ is a continuous function
- (c) $f(x) = g(x) \times h(x) = \sin x \times \cos x$ is a continuous function

Question 22:

Discuss the continuity of the cosine, cosecant, secant and cotangent functions,

Answer

It is known that if g and h are two continuous functions, then

(i) $\frac{h(x)}{g(x)}$, $g(x) \neq 0$ is continuous (ii) $\frac{1}{g(x)}$, $g(x) \neq 0$ is continuous (iii) $\frac{1}{h(x)}$, $h(x) \neq 0$ is continuous

It has to be proved first that $g(x) = \sin x$ and $h(x) = \cos x$ are continuous functions.

Let
$$g(x) = \sin x$$

It is evident that $g(x) = \sin x$ is defined for every real number.

Let c be a real number. Put
$$x = c + h$$

If
$$x \rightarrow c$$
, then $h \rightarrow 0$
 $g(c) = \sin c$
 $\lim_{x \rightarrow c} g(x) = \limsup_{x \rightarrow c} \sin x$
 $= \lim_{h \rightarrow 0} \sin (c+h)$
 $= \lim_{h \rightarrow 0} [\sin c \cos h + \cos c \sin h]$
 $= \lim_{h \rightarrow 0} (\sin c \cos h) + \lim_{h \rightarrow 0} (\cos c \sin h)$
 $= \sin c \cos 0 + \cos c \sin 0$
 $= \sin c + 0$
 $= \sin c$
 $\therefore \lim_{x \rightarrow c} g(x) = g(c)$

Therefore, g is a continuous function.

Let $h(x) = \cos x$ It is evident that $h(x) = \cos x$ is defined for every real number. Let c be a real number. Put x = c + hIf $x \otimes c$, then $h \otimes 0$ $h(c) = \cos c$

$$\lim_{x \to c} h(x) = \lim_{x \to c} \cos x$$

= $\lim_{h \to 0} \cos(c+h)$
= $\lim_{h \to 0} [\cos c \cos h - \sin c \sin h]$
= $\lim_{h \to 0} \cos c \cos h - \lim_{h \to 0} \sin c \sin h$
= $\cos c \cos 0 - \sin c \sin 0$
= $\cos c \times 1 - \sin c \times 0$
= $\cos c$
 $\therefore \lim_{x \to c} h(x) = h(c)$

Therefore, $h(x) = \cos x$ is continuous function.

It can be concluded that,

 $\operatorname{cosec} x = \frac{1}{\sin x}, \ \sin x \neq 0 \text{ is continuous}$

 \Rightarrow cosec x, $x \neq n\pi$ $(n \in Z)$ is continuous

Therefore, cosecant is continuous except at x = np, $n \hat{1} \mathbf{Z}$

 $\sec x = \frac{1}{\cos x}, \ \cos x \neq 0$ is continuous

$$\Rightarrow$$
 sec x, $x \neq (2n+1)\frac{\pi}{2}$ $(n \in \mathbb{Z})$ is continuous

$$x = (2n+1)\frac{\pi}{2} \ (n \in \mathbf{Z})$$

Therefore, secant is continuous except at

 $\cot x = \frac{\cos x}{\sin x}, \ \sin x \neq 0 \text{ is continuous}$ $\Rightarrow \cot x, \ x \neq n\pi \ (n \in Z) \text{ is continuous}$

Therefore, cotangent is continuous except at x = np, $n \hat{I} \mathbf{Z}$

Question 23:

Find the points of discontinuity of *f*, where

$$f(x) = \begin{cases} \frac{\sin x}{x}, & \text{if } x < 0\\ x+1, & \text{if } x \ge 0 \end{cases}$$

$$f(x) = \begin{cases} \frac{\sin x}{x}, & \text{if } x < 0\\ x+1, & \text{if } x \ge 0 \end{cases}$$

The given function *f* is

It is evident that f is defined at all points of the real line. Let c be a real number.

Case I:

If
$$c < 0$$
, then $f(c) = \frac{\sin c}{c}$ and $\lim_{x \to c} f(x) = \lim_{x \to c} \left(\frac{\sin x}{x} \right) = \frac{\sin c}{c}$
$$\therefore \lim_{x \to c} f(x) = f(c)$$

Therefore, *f* is continuous at all points *x*, such that x < 0Case II:

If
$$c > 0$$
, then $f(c) = c + 1$ and $\lim_{x \to c} f(x) = \lim_{x \to c} (x + 1) = c + 1$
: $\lim_{x \to c} f(x) = f(c)$

Therefore, *f* is continuous at all points *x*, such that x > 0Case III:

If c = 0, then f(c) = f(0) = 0 + 1 = 1

The left hand limit of f at x = 0 is,

$$\lim_{x \to 0^-} f(x) = \lim_{x \to 0} \frac{\sin x}{x} = 1$$

The right hand limit of f at x = 0 is,

$$\lim_{x \to 0^+} f(x) = \lim_{x \to 0^+} (x+1) = 1$$

$$\therefore \lim_{x \to 0^-} f(x) = \lim_{x \to 0^+} f(x) = f(0)$$

Therefore, f is continuous at x = 0

From the above observations, it can be concluded that f is continuous at all points of the real line.

Thus, *f* has no point of discontinuity.

Question 24:

Determine if *f* defined by

$$f(x) = \begin{cases} x^2 \sin \frac{1}{x}, & \text{if } x \neq 0\\ 0, & \text{if } x = 0 \end{cases}$$

is a continuous function?

Answer

$$f(x) = \begin{cases} x^2 \sin \frac{1}{x}, & \text{if } x \neq 0\\ 0, & \text{if } x = 0 \end{cases}$$

The given function *f* is

It is evident that f is defined at all points of the real line. Let c be a real number.

Case I:

If
$$c \neq 0$$
, then $f(c) = c^2 \sin \frac{1}{c}$

$$\lim_{x \to c} f(x) = \lim_{x \to c} \left(x^2 \sin \frac{1}{x} \right) = \left(\lim_{x \to c} x^2 \right) \left(\lim_{x \to c} \sin \frac{1}{x} \right) = c^2 \sin \frac{1}{c}$$

$$\therefore \lim_{x \to c} f(x) = f(c)$$

Therefore, f is continuous at all points $x \neq 0$ Case II:

If c = 0, then f(0) = 0

$$\lim_{x \to 0^{-}} f(x) = \lim_{x \to 0^{-}} \left(x^2 \sin \frac{1}{x} \right) = \lim_{x \to 0} \left(x^2 \sin \frac{1}{x} \right)$$

It is known that, $-1 \le \sin \frac{1}{x} \le 1$, $x \ne 0$
 $\Rightarrow -x^2 \le \sin \frac{1}{x} \le x^2$
 $\Rightarrow \lim_{x \to 0} \left(-x^2 \right) \le \lim_{x \to 0} \left(x^2 \sin \frac{1}{x} \right) \le \lim_{x \to 0} x^2$
 $\Rightarrow 0 \le \lim_{x \to 0} \left(x^2 \sin \frac{1}{x} \right) \le 0$
 $\Rightarrow \lim_{x \to 0} \left(x^2 \sin \frac{1}{x} \right) = 0$
 $\therefore \lim_{x \to 0^{-}} f(x) = 0$

Similarly, $\lim_{x \to 0^+} f(x) = \lim_{x \to 0^+} \left(x^2 \sin \frac{1}{x} \right) = \lim_{x \to 0} \left(x^2 \sin \frac{1}{x} \right) = 0$

$$\therefore \lim_{x \to 0^{-}} f(x) = f(0) = \lim_{x \to 0^{+}} f(x)$$

Therefore, f is continuous at x = 0

From the above observations, it can be concluded that f is continuous at every point of the real line.

Thus, *f* is a continuous function.

Question 25:

Examine the continuity of *f*, where *f* is defined by

$$f(x) = \begin{cases} \sin x - \cos x, \text{ if } x \neq 0\\ -1 & \text{ if } x = 0 \end{cases}$$

Answer

$$f(x) = \begin{cases} \sin x - \cos x, \text{ if } x \neq 0\\ -1 & \text{ if } x = 0 \end{cases}$$

The given function *f* is

It is evident that f is defined at all points of the real line.

Let c be a real number.

Case I:

If $c \neq 0$, then $f(c) = \sin c - \cos c$ $\lim_{x \to c} f(x) = \lim_{x \to c} (\sin x - \cos x) = \sin c - \cos c$ $\therefore \lim_{x \to c} f(x) = f(c)$

Therefore, *f* is continuous at all points *x*, such that $x \neq 0$ Case II:

If
$$c = 0$$
, then $f(0) = -1$

$$\lim_{x \to 0^{-}} f(x) = \lim_{x \to 0} (\sin x - \cos x) = \sin 0 - \cos 0 = 0 - 1 = -1$$

$$\lim_{x \to 0^{+}} f(x) = \lim_{x \to 0^{+}} (\sin x - \cos x) = \sin 0 - \cos 0 = 0 - 1 = -1$$

$$\therefore \lim_{x \to 0^{-}} f(x) = \lim_{x \to 0^{+}} f(x) = f(0)$$

Therefore, f is continuous at x = 0

From the above observations, it can be concluded that f is continuous at every point of the real line.

Thus, *f* is a continuous function.

Question 26:

Find the values of k so that the function f is continuous at the indicated point.

$$f(x) = \begin{cases} \frac{k\cos x}{\pi - 2x}, & \text{if } x \neq \frac{\pi}{2} \\ 3, & \text{if } x = \frac{\pi}{2} \end{cases} \quad \text{at } x = \frac{\pi}{2} \end{cases}$$

Answer

$$f(x) = \begin{cases} \frac{k\cos x}{\pi - 2x}, & \text{if } x \neq \frac{\pi}{2} \\ 3, & \text{if } x = \frac{\pi}{2} \end{cases}$$

The given function *f* is

The given function *f* is continuous at $x = \frac{\pi}{2}$, if *f* is defined at $x = \frac{\pi}{2}$ and if the value of the *f*

$$x = \frac{\pi}{2}$$
 equals the limit of *f* at $x = \frac{\pi}{2}$.

It is evident that *f* is defined at $x = \frac{\pi}{2}$ and $f\left(\frac{\pi}{2}\right) = 3$

$$\lim_{x \to \frac{\pi}{2}} f(x) = \lim_{x \to \frac{\pi}{2}} \frac{k \cos x}{\pi - 2x}$$
Put $x = \frac{\pi}{2} + h$
Then, $x \to \frac{\pi}{2} \Rightarrow h \to 0$
 $\therefore \lim_{x \to \frac{\pi}{2}} f(x) = \lim_{x \to \frac{\pi}{2}} \frac{k \cos x}{\pi - 2x} = \lim_{h \to 0} \frac{k \cos\left(\frac{\pi}{2} + h\right)}{\pi - 2\left(\frac{\pi}{2} + h\right)}$

$$= k \lim_{h \to 0} \frac{-\sin h}{-2h} = \frac{k}{2} \lim_{h \to 0} \frac{\sin h}{h} = \frac{k}{2} \cdot 1 = \frac{k}{2}$$
 $\therefore \lim_{x \to \frac{\pi}{2}} f(x) = f\left(\frac{\pi}{2}\right)$

$$\Rightarrow \frac{k}{2} = 3$$

$$\Rightarrow k = 6$$

Therefore, the required value of k is 6.

Question 27:

Find the values of k so that the function f is continuous at the indicated point.

$$f(x) = \begin{cases} kx^2, & \text{if } x \le 2\\ 3, & \text{if } x > 2 \end{cases} \quad \text{at } x = 2$$

Answer

$$f(x) = \begin{cases} kx^2, & \text{if } x \le 2\\ 3, & \text{if } x > 2 \end{cases}$$

The given function is

The given function f is continuous at x = 2, if f is defined at x = 2 and if the value of f at x = 2 equals the limit of f at x = 2

It is evident that f is defined at x = 2 and $f(2) = k(2)^2 = 4k$

 $\lim_{x \to 2^{-}} f(x) = \lim_{x \to 2^{+}} f(x) = f(2)$ $\Rightarrow \lim_{x \to 2^{-}} (kx^{2}) = \lim_{x \to 2^{+}} (3) = 4k$ $\Rightarrow k \times 2^{2} = 3 = 4k$ $\Rightarrow 4k = 3 = 4k$ $\Rightarrow 4k = 3$ $\Rightarrow k = \frac{3}{4}$

Therefore, the required value of $\frac{k \text{ is } \frac{3}{4}}{4}$.

Question 28:

Find the values of k so that the function f is continuous at the indicated point.

$$f(x) = \begin{cases} kx+1, & \text{if } x \le \pi \\ \cos x, & \text{if } x > \pi \end{cases} \quad \text{at } x = \pi$$

Answer

$$f(x) = \begin{cases} kx+1, & \text{if } x \le \pi\\ \cos x, & \text{if } x > \pi \end{cases}$$

The given function f is continuous at x = p, if f is defined at x = p and if the value of f at x = p equals the limit of f at x = p

It is evident that f is defined at x = p and $f(\pi) = k\pi + 1$

$$\lim_{x \to \pi^-} f(x) = \lim_{x \to \pi^+} f(x) = f(\pi)$$

$$\Rightarrow \lim_{x \to \pi^-} (kx+1) = \lim_{x \to \pi^+} \cos x = k\pi + 1$$

$$\Rightarrow k\pi + 1 = \cos \pi = k\pi + 1$$

$$\Rightarrow k\pi + 1 = -1 = k\pi + 1$$

$$\Rightarrow k = -\frac{2}{\pi}$$

k is $-\frac{2}{\pi}$. Therefore, the required value of

Question 29:

Find the values of k so that the function f is continuous at the indicated point.

$$f(x) = \begin{cases} kx+1, & \text{if } x \le 5\\ 3x-5, & \text{if } x > 5 \end{cases} \quad \text{at } x = 5$$

Answer

$$f(x) = \begin{cases} kx+1, & \text{if } x \le 5\\ 3x-5, & \text{if } x > 5 \end{cases}$$

The given function f is continuous at x = 5, if f is defined at x = 5 and if the value of f at x = 5 equals the limit of f at x = 5

It is evident that f is defined at x = 5 and f(5) = kx + 1 = 5k + 1

$$\lim_{x \to 5^{-}} f(x) = \lim_{x \to 5^{+}} f(x) = f(5)$$

$$\Rightarrow \lim_{x \to 5^{-}} (kx+1) = \lim_{x \to 5^{+}} (3x-5) = 5k+1$$

$$\Rightarrow 5k+1 = 15-5 = 5k+1$$

$$\Rightarrow 5k+1 = 10$$

$$\Rightarrow 5k = 9$$

$$\Rightarrow k = \frac{9}{5}$$
Therefore, the required value of

Therefore, the required value of

Question 30:

Find the values of *a* and *b* such that the function defined by

$$f(x) = \begin{cases} 5, & \text{if } x \le 2\\ ax + b, \text{if } 2 < x < 10\\ 21, & \text{if } x \ge 10 \end{cases}$$

is a continuous function.

$$f(x) = \begin{cases} 5, & \text{if } x \le 2\\ ax + b, \text{if } 2 < x < 10\\ 21, & \text{if } x \ge 10 \end{cases}$$

The given function *f* is

It is evident that the given function f is defined at all points of the real line.

If f is a continuous function, then f is continuous at all real numbers.

In particular, *f* is continuous at x = 2 and x = 10

Since *f* is continuous at x = 2, we obtain

$$\lim_{x \to 2^{-}} f(x) = \lim_{x \to 2^{+}} f(x) = f(2)$$

$$\Rightarrow \lim_{x \to 2^{-}} (5) = \lim_{x \to 2^{+}} (ax + b) = 5$$

$$\Rightarrow 5 = 2a + b = 5$$

$$\Rightarrow 2a + b = 5 \qquad \dots (1)$$

Since *f* is continuous at x = 10, we obtain

$$\lim_{x \to 10^{-}} f(x) = \lim_{x \to 10^{+}} f(x) = f(10)$$

$$\Rightarrow \lim_{x \to 10^{-}} (ax+b) = \lim_{x \to 10^{+}} (21) = 21$$

$$\Rightarrow 10a+b=21 = 21$$

$$\Rightarrow 10a+b=21 \qquad \dots (2)$$

On subtracting equation (1) from equation (2), we obtain

 $\Rightarrow a = 2$

By putting a = 2 in equation (1), we obtain $2 \times 2 + b = 5$

 $\Rightarrow 4 + b = 5$

 $\Rightarrow b = 1$

Therefore, the values of a and b for which f is a continuous function are 2 and 1 respectively.

Question 31:

Show that the function defined by $f(x) = \cos(x^2)$ is a continuous function.

Answer

The given function is $f(x) = \cos(x^2)$

This function f is defined for every real number and f can be written as the composition of two functions as,

$$f = g \circ h$$
, where $g(x) = \cos x$ and $h(x) = x^2$

$$\left[\because (goh)(x) = g(h(x)) = g(x^2) = \cos(x^2) = f(x)\right]$$

It has to be first proved that $g(x) = \cos x$ and $h(x) = x^2$ are continuous functions.

It is evident that g is defined for every real number.

Let c be a real number.
Then,
$$g(c) = \cos c$$

Put $x = c + h$
If $x \to c$, then $h \to 0$
 $\lim_{x \to c} g(x) = \lim_{x \to c} \cos x$
 $= \lim_{h \to 0} \cos (c + h)$
 $= \lim_{h \to 0} [\cos c \cos h - \sin c \sin h]$
 $= \lim_{h \to 0} \cos c \cos h - \lim_{h \to 0} \sin c \sin h$
 $= \cos c \cos 0 - \sin c \sin 0$
 $= \cos c c \cos c$
 $\therefore \lim_{x \to c} g(x) = g(c)$

Therefore, $g(x) = \cos x$ is continuous function.

 $h(x) = x^2$

Clearly, *h* is defined for every real number. Let *k* be a real number, then $h(k) = k^2$

$$\lim_{x \to k} h(x) = \lim_{x \to k} x^2 = k^2$$

$$\therefore \lim_{x \to k} h(x) = h(k)$$

Therefore, *h* is a continuous function.

It is known that for real valued functions g and h, such that $(g \circ h)$ is defined at c, if g is continuous at c and if f is continuous at g(c), then $(f \circ g)$ is continuous at c.

Therefore, $f(x) = (goh)(x) = cos(x^2)$ is a continuous function.

Question 32:

Show that the function defined by $f(x) = |\cos x|$ is a continuous function. Answer

The given function is $f(x) = |\cos x|$

This function f is defined for every real number and f can be written as the composition of two functions as,

$$f = g \ o \ h, \text{ where } g(x) = |x| \text{ and } h(x) = \cos x$$
$$\left[\because (goh)(x) = g(h(x)) = g(\cos x) = |\cos x| = f(x) \right]$$

It has to be first proved that g(x) = |x| and $h(x) = \cos x$ are continuous functions.

g(x) = |x| can be written as

$$g(x) = \begin{cases} -x, & \text{if } x < 0 \\ x, & \text{if } x \ge 0 \end{cases}$$

Clearly, g is defined for all real numbers.

Let c be a real number.

Case I:

If c < 0, then g(c) = -c and $\lim_{x \to c} g(x) = \lim_{x \to c} (-x) = -c$ $\therefore \lim_{x \to c} g(x) = g(c)$ Therefore, g is continuous at all points x, such that x < 0Case II:

If
$$c > 0$$
, then $g(c) = c$ and $\lim_{x \to c} g(x) = \lim_{x \to c} x = c$
 $\therefore \lim_{x \to c} g(x) = g(c)$

Therefore, g is continuous at all points x, such that x > 0Case III:

If
$$c = 0$$
, then $g(c) = g(0) = 0$

$$\lim_{x \to 0^{-}} g(x) = \lim_{x \to 0^{-}} (-x) = 0$$

$$\lim_{x \to 0^{+}} g(x) = \lim_{x \to 0^{+}} (x) = 0$$

$$\therefore \lim_{x \to 0^{-}} g(x) = \lim_{x \to 0^{+}} (x) = g(0)$$

Therefore, g is continuous at x = 0

From the above three observations, it can be concluded that g is continuous at all points.

$$h(x) = \cos x$$

It is evident that $h(x) = \cos x$ is defined for every real number.

Let c be a real number. Put
$$x = c + h$$

If $x \to c$, then $h \to 0$
 $h(c) = \cos c$
 $\lim_{x \to c} h(x) = \lim_{x \to c} \cos x$
 $= \lim_{h \to 0} \cos(c + h)$
 $= \lim_{h \to 0} [\cos c \cos h - \sin c \sin h]$
 $= \lim_{h \to 0} \cos c \cos h - \lim_{h \to 0} \sin c \sin h$
 $= \cos c \cos 0 - \sin c \sin 0$
 $= \cos c \times 1 - \sin c \times 0$
 $= \cos c$
 $\therefore \lim_{x \to c} h(x) = h(c)$

Therefore, $h(x) = \cos x$ is a continuous function.

It is known that for real valued functions g and h, such that $(g \circ h)$ is defined at c, if g is continuous at c and if f is continuous at g (c), then ($f \circ g$) is continuous at c.

Therefore,
$$f(x) = (goh)(x) = g(h(x)) = g(\cos x) = |\cos x|$$
 is a continuous function.

Question 33:

Examine that $\frac{\sin|x|}{\sin x}$ is a continuous function.

Answei

Let
$$f(x) = \sin|x|$$

This function f is defined for every real number and f can be written as the composition of two functions as,

$$f = g \ o \ h, \text{ where } g(x) = |x| \text{ and } h(x) = \sin x$$
$$\left[\because (goh)(x) = g(h(x)) = g(\sin x) = |\sin x| = f(x) \right]$$

It has to be proved first that g(x) = |x| and $h(x) = \sin x$ are continuous functions.

$$g(x) = |x|$$
 can be written as

$$g(x) = \begin{cases} -x, & \text{if } x < 0 \\ x, & \text{if } x \ge 0 \end{cases}$$

Clearly, *g* is defined for all real numbers.

Let c be a real number.

Case I:

If
$$c < 0$$
, then $g(c) = -c$ and $\lim_{x \to c} g(x) = \lim_{x \to c} (-x) = -c$
 $\therefore \lim_{x \to c} g(x) = g(c)$

Therefore, g is continuous at all points x, such that x < 0Case II:

If
$$c > 0$$
, then $g(c) = c$ and $\lim_{x \to c} g(x) = \lim_{x \to c} x = c$
 $\therefore \lim_{x \to c} g(x) = g(c)$

Therefore, g is continuous at all points x, such that x > 0Case III:

If c = 0, then g(c) = g(0) = 0

 $\lim_{x \to 0^{-}} g(x) = \lim_{x \to 0^{-}} (-x) = 0$ $\lim_{x \to 0^{+}} g(x) = \lim_{x \to 0^{+}} (x) = 0$ $\therefore \lim_{x \to 0^{-}} g(x) = \lim_{x \to 0^{+}} (x) = g(0)$

```
Therefore, g is continuous at x = 0
```

From the above three observations, it can be concluded that g is continuous at all points.

$$h(x) = \sin x$$

It is evident that $h(x) = \sin x$ is defined for every real number.

```
Let c be a real number. Put x = c + k
```

```
If x \to c, then k \to 0

h(c) = \sin c

h(c) = \sin c

\lim_{x \to c} h(x) = \limsup_{x \to c} \sin x

= \lim_{k \to 0} \sin (c+k)

= \lim_{k \to 0} [\sin c \cos k + \cos c \sin k]

= \lim_{k \to 0} (\sin c \cos k) + \lim_{h \to 0} (\cos c \sin k)

= \sin c \cos 0 + \cos c \sin 0

= \sin c + 0

= \sin c

\therefore \lim_{x \to c} h(x) = g(c)
```

Therefore, h is a continuous function.

It is known that for real valued functions g and h, such that $(g \circ h)$ is defined at c, if g is continuous at c and if f is continuous at g(c), then $(f \circ g)$ is continuous at c.

Therefore,
$$f(x) = (goh)(x) = g(h(x)) = g(\sin x) = |\sin x|$$
 is a continuous function.

Question 34:

Find all the points of discontinuity of *f* defined by f(x) = |x| - |x+1|. Answer

The given function is f(x) = |x| - |x+1|

The two functions, g and h, are defined as

$$g(x) = |x|$$
 and $h(x) = |x+1|$

Then, f = g - h

The continuity of g and h is examined first.

$$g(x) = |x| \text{ can be written as}$$
$$g(x) = \begin{cases} -x, & \text{if } x < 0 \\ x, & \text{if } x \ge 0 \end{cases}$$

Clearly, *g* is defined for all real numbers.

Let *c* be a real number.

Case I:

If
$$c < 0$$
, then $g(c) = -c$ and $\lim_{x \to c} g(x) = \lim_{x \to c} (-x) = -c$
 $\therefore \lim_{x \to c} g(x) = g(c)$

Therefore, g is continuous at all points x, such that x < 0Case II:

If
$$c > 0$$
, then $g(c) = c$ and $\lim_{x \to c} g(x) = \lim_{x \to c} x = c$
 $\therefore \lim_{x \to c} g(x) = g(c)$

$$\lim_{x\to c} g(x) = g(c)$$

Therefore, *g* is continuous at all points *x*, such that x > 0

Case III:

If
$$c = 0$$
, then $g(c) = g(0) = 0$

$$\lim_{x \to 0^{-}} g(x) = \lim_{x \to 0^{-}} (-x) = 0$$

$$\lim_{x \to 0^{+}} g(x) = \lim_{x \to 0^{+}} (x) = 0$$

$$\therefore \lim_{x \to 0^{-}} g(x) = \lim_{x \to 0^{+}} (x) = g(0)$$

Therefore, g is continuous at x = 0

From the above three observations, it can be concluded that g is continuous at all points.

$$h(x) = |x+1| \text{ can be written as}$$
$$h(x) = \begin{cases} -(x+1), & \text{if, } x < -1\\ x+1, & \text{if } x \ge -1 \end{cases}$$

Clearly, *h* is defined for every real number.

Let c be a real number.

Case I:

If
$$c < -1$$
, then $h(c) = -(c+1)$ and $\lim_{x \to c} h(x) = \lim_{x \to c} [-(x+1)] = -(c+1)$
 $\therefore \lim_{x \to c} h(x) = h(c)$

Therefore, *h* is continuous at all points *x*, such that x < -1Case II:

If
$$c > -1$$
, then $h(c) = c + 1$ and $\lim_{x \to c} h(x) = \lim_{x \to c} (x + 1) = c + 1$
: $\lim_{x \to c} h(x) = h(c)$

Therefore, *h* is continuous at all points *x*, such that x > -1 Case III:

If
$$c = -1$$
, then $h(c) = h(-1) = -1 + 1 = 0$

$$\lim_{x \to -1^-} h(x) = \lim_{x \to -1^-} \left[-(x+1) \right] = -(-1+1) = 0$$

$$\lim_{x \to -1^+} h(x) = \lim_{x \to -1^+} (x+1) = (-1+1) = 0$$

$$\therefore \lim_{x \to -1^-} h(x) = \lim_{h \to -1^+} h(x) = h(-1)$$

Therefore, *h* is continuous at x = -1

From the above three observations, it can be concluded that h is continuous at all points of the real line.

g and h are continuous functions. Therefore, f = g - h is also a continuous function. Therefore, f has no point of discontinuity. Exercise 5.2

Question 1:

Differentiate the functions with respect to x.

 $\sin(x^2+5)$

Answer

Let
$$f(x) = \sin(x^2 + 5)$$
, $u(x) = x^2 + 5$, and $v(t) = \sin t$
Then, $(vou)(x) = v(u(x)) = v(x^2 + 5) = \tan(x^2 + 5) = f(x)$

Thus, *f* is a composite of two functions.

$$Put \ t = u(x) = x^2 + 5$$

Then, we obtain

$$\frac{dv}{dt} = \frac{d}{dt}(\sin t) = \cos t = \cos\left(x^2 + 5\right)$$
$$\frac{dt}{dx} = \frac{d}{dx}\left(x^2 + 5\right) = \frac{d}{dx}\left(x^2\right) + \frac{d}{dx}\left(5\right) = 2x + 0 = 2x$$
$$\text{Therefore, by chain rule, } \frac{df}{dx} = \frac{dv}{dt} \cdot \frac{dt}{dx} = \cos\left(x^2 + 5\right) \times 2x = 2x\cos\left(x^2 + 5\right)$$

Alternate method

$$\frac{d}{dx}\left[\sin\left(x^2+5\right)\right] = \cos\left(x^2+5\right) \cdot \frac{d}{dx}\left(x^2+5\right)$$
$$= \cos\left(x^2+5\right) \cdot \left[\frac{d}{dx}\left(x^2\right) + \frac{d}{dx}\left(5\right)\right]$$
$$= \cos\left(x^2+5\right) \cdot \left[2x+0\right]$$
$$= 2x\cos\left(x^2+5\right)$$

Question 2:

Differentiate the functions with respect to *x*. $\cos(\sin x)$

Answer

Let
$$f(x) = \cos(\sin x)$$
, $u(x) = \sin x$, and $v(t) = \cos t$
Then, $(vou)(x) = v(u(x)) = v(\sin x) = \cos(\sin x) = f(x)$

Thus, *f* is a composite function of two functions.

Put
$$t = u(x) = \sin x$$

$$\therefore \frac{dv}{dt} = \frac{d}{dt} [\cos t] = -\sin t = -\sin(\sin x)$$

$$\frac{dt}{dx} = \frac{d}{dx} (\sin x) = \cos x$$
By chain rule, $\frac{df}{dx} = \frac{dv}{dt} \cdot \frac{dt}{dx} = -\sin(\sin x) \cdot \cos x = -\cos x \sin(\sin x)$

Alternate method

$$\frac{d}{dx} \Big[\cos(\sin x) \Big] = -\sin(\sin x) \cdot \frac{d}{dx} (\sin x) = -\sin(\sin x) \cdot \cos x = -\cos x \sin(\sin x)$$

Question 3:

Differentiate the functions with respect to x.

 $\sin(ax+b)$

Answer

Let
$$f(x) = \sin(ax+b)$$
, $u(x) = ax+b$, and $v(t) = \sin t$
Then, $(vou)(x) = v(u(x)) = v(ax+b) = \sin(ax+b) = f(x)$

Thus, f is a composite function of two functions, u and v.

$$Put t = u (x) = ax + b$$

Therefore,

$$\frac{dv}{dt} = \frac{d}{dt}(\sin t) = \cos t = \cos(ax+b)$$
$$\frac{dt}{dx} = \frac{d}{dx}(ax+b) = \frac{d}{dx}(ax) + \frac{d}{dx}(b) = a+0 = a$$

Hence, by chain rule, we obtain

$$\frac{df}{dx} = \frac{dv}{dt} \cdot \frac{dt}{dx} = \cos(ax+b) \cdot a = a\cos(ax+b)$$

Alternate method

$$\frac{d}{dx} \left[\sin(ax+b) \right] = \cos(ax+b) \cdot \frac{d}{dx} (ax+b)$$
$$= \cos(ax+b) \cdot \left[\frac{d}{dx} (ax) + \frac{d}{dx} (b) \right]$$
$$= \cos(ax+b) \cdot (a+0)$$
$$= a \cos(ax+b)$$

Question 4:

Differentiate the functions with respect to x.

 $\operatorname{sec}(\operatorname{tan}(\sqrt{x}))$

Answer

Let
$$f(x) = \sec(\tan\sqrt{x}), u(x) = \sqrt{x}, v(t) = \tan t$$
, and $w(s) = \sec s$
Then, $(wovou)(x) = w[v(u(x))] = w[v(\sqrt{x})] = w(\tan\sqrt{x}) = \sec(\tan\sqrt{x}) = f(x)$

Thus, f is a composite function of three functions, u, v, and w.

Put $s = v(t) = \tan t$ and $t = u(x) = \sqrt{x}$

Then,
$$\frac{dw}{ds} = \frac{d}{ds}(\sec s) = \sec s \tan s = \sec(\tan t) \cdot \tan(\tan t)$$
 [$s = \tan t$]
 $= \sec(\tan \sqrt{x}) \cdot \tan(\tan \sqrt{x})$ [$t = \sqrt{x}$]
 $\frac{ds}{dt} = \frac{d}{dt}(\tan t) = \sec^2 t = \sec^2 \sqrt{x}$
 $\frac{dt}{dx} = \frac{d}{dx}(\sqrt{x}) = \frac{d}{dx}\left(x^{\frac{1}{2}}\right) = \frac{1}{2} \cdot x^{\frac{1}{2}-1} = \frac{1}{2\sqrt{x}}$

Hence, by chain rule, we obtain

$$\frac{dt}{dx} = \frac{dw}{ds} \cdot \frac{ds}{dt} \cdot \frac{dt}{dx}$$
$$= \sec\left(\tan\sqrt{x}\right) \cdot \tan\left(\tan\sqrt{x}\right) \times \sec^{2}\sqrt{x} \times \frac{1}{2\sqrt{x}}$$
$$= \frac{1}{2\sqrt{x}} \sec^{2}\sqrt{x} \sec\left(\tan\sqrt{x}\right) \tan\left(\tan\sqrt{x}\right)$$
$$= \frac{\sec^{2}\sqrt{x} \sec\left(\tan\sqrt{x}\right) \tan\left(\tan\sqrt{x}\right)}{2\sqrt{x}}$$

Alternate method

$$\frac{d}{dx} \left[\sec\left(\tan\sqrt{x}\right) \right] = \sec\left(\tan\sqrt{x}\right) \cdot \tan\left(\tan\sqrt{x}\right) \cdot \frac{d}{dx} \left(\tan\sqrt{x}\right)$$
$$= \sec\left(\tan\sqrt{x}\right) \cdot \tan\left(\tan\sqrt{x}\right) \cdot \sec^{2}\left(\sqrt{x}\right) \cdot \frac{d}{dx} \left(\sqrt{x}\right)$$
$$= \sec\left(\tan\sqrt{x}\right) \cdot \tan\left(\tan\sqrt{x}\right) \cdot \sec^{2}\left(\sqrt{x}\right) \cdot \frac{1}{2\sqrt{x}}$$
$$= \frac{\sec\left(\tan\sqrt{x}\right) \cdot \tan\left(\tan\sqrt{x}\right) \sec^{2}\left(\sqrt{x}\right)}{2\sqrt{x}}$$

Question 5:

Differentiate the functions with respect to x.

 $\frac{\sin\left(ax+b\right)}{\cos\left(cx+d\right)}$

Answer

 $f(x) = \frac{\sin(ax+b)}{\cos(cx+d)} = \frac{g(x)}{h(x)}, \text{ where } g(x) = \sin(ax+b) \text{ and } h(x) = \cos(cx+d)$ $\therefore f' = \frac{g'h - gh'}{h^2}$ Consider $g(x) = \sin(ax+b)$ Let $u(x) = ax + b, v(t) = \sin t$ Then, $(vou)(x) = v(u(x)) = v(ax+b) = \sin(ax+b) = g(x)$ \therefore *g* is a composite function of two functions, *u* and *v*.

Put
$$t = u(x) = ax + b$$

 $\frac{dv}{dt} = \frac{d}{dt}(\sin t) = \cos t = \cos(ax + b)$
 $\frac{dt}{dx} = \frac{d}{dx}(ax + b) = \frac{d}{dx}(ax) + \frac{d}{dx}(b) = a + 0 = a$

Therefore, by chain rule, we obtain

$$g' = \frac{dg}{dx} = \frac{dv}{dt} \cdot \frac{dt}{dx} = \cos(ax+b) \cdot a = a\cos(ax+b)$$

Consider $h(x) = \cos(cx+d)$
Let $p(x) = cx+d$, $q(y) = \cos y$
Then, $(qop)(x) = q(p(x)) = q(cx+d) = \cos(cx+d) = h(x)$

 $\therefore h$ is a composite function of two functions, p and q.

Put
$$y = p(x) = cx + d$$

$$\frac{dq}{dy} = \frac{d}{dy}(\cos y) = -\sin y = -\sin(cx + d)$$

$$\frac{dy}{dx} = \frac{d}{dx}(cx + d) = \frac{d}{dx}(cx) + \frac{d}{dx}(d) = c$$

Therefore, by chain rule, we obtain

$$h' = \frac{dh}{dx} = \frac{dq}{dy} \cdot \frac{dy}{dx} = -\sin\left(cx+d\right) \times c = -c\sin\left(cx+d\right)$$

$$\therefore f' = \frac{a\cos(ax+b)\cdot\cos(cx+d) - \sin(ax+b)\{-c\sin(cx+d)\}}{\left[\cos(cx+d)\right]^2}$$
$$= \frac{a\cos(ax+b)}{\cos(cx+d)} + c\sin(ax+b)\cdot\frac{\sin(cx+d)}{\cos(cx+d)} \times \frac{1}{\cos(cx+d)}$$
$$= a\cos(ax+b)\sec(cx+d) + c\sin(ax+b)\tan(cx+d)\sec(cx+d)$$

Question 6:

Differentiate the functions with respect to x.

$$\cos x^3 \cdot \sin^2(x^5)$$

Answer

The given function is $\cos x^3 . \sin^2 (x^5)$.

$$\frac{d}{dx} \Big[\cos x^3 \cdot \sin^2 (x^5) \Big] = \sin^2 (x^5) \times \frac{d}{dx} \Big(\cos x^3 \Big) + \cos x^3 \times \frac{d}{dx} \Big[\sin^2 (x^5) \Big] \\ = \sin^2 (x^5) \times (-\sin x^3) \times \frac{d}{dx} (x^3) + \cos x^3 \times 2\sin (x^5) \cdot \frac{d}{dx} \Big[\sin x^5 \Big] \\ = -\sin x^3 \sin^2 (x^5) \times 3x^2 + 2\sin x^5 \cos x^3 \cdot \cos x^5 \times \frac{d}{dx} (x^5) \\ = -3x^2 \sin x^3 \cdot \sin^2 (x^5) + 2\sin x^5 \cos x^5 \cos x^3 \cdot x^5 \\ = 10x^4 \sin x^5 \cos x^5 \cos x^3 - 3x^2 \sin x^3 \sin^2 (x^5) \Big]$$

Question 7:

Differentiate the functions with respect to x.

$$2\sqrt{\cot(x^2)}$$

Answer

$$\frac{d}{dx} \left[2\sqrt{\cot(x^2)} \right]$$

$$= 2 \cdot \frac{1}{2\sqrt{\cot(x^2)}} \times \frac{d}{dx} \left[\cot(x^2) \right]$$

$$= \sqrt{\frac{\sin(x^2)}{\cos(x^2)}} \times -\csc^2(x^2) \times \frac{d}{dx}(x^2)$$

$$= -\sqrt{\frac{\sin(x^2)}{\cos(x^2)}} \times \frac{1}{\sin^2(x^2)} \times (2x)$$

$$= \frac{-2x}{\sqrt{\cos x^2} \sqrt{\sin x^2} \sin x^2}$$

$$= \frac{-2\sqrt{2}x}{\sqrt{2\sin x^2} \cos x^2 \sin x^2}$$

$$= \frac{-2\sqrt{2}x}{\sin x^2 \sqrt{\sin 2x^2}}$$

Question 8:

Differentiate the functions with respect to x.

$$\cos(\sqrt{x})$$

Answer

Let
$$f(x) = \cos(\sqrt{x})$$

Also, let $u(x) = \sqrt{x}$
And, $v(t) = \cos t$
Then, $(vou)(x) = v(u(x))$
 $= v(\sqrt{x})$
 $= \cos \sqrt{x}$
 $= f(x)$

Clearly, f is a composite function of two functions, u and v, such that $t=u\left(x\right)=\sqrt{x}$

Then,
$$\frac{dt}{dx} = \frac{d}{dx} \left(\sqrt{x} \right) = \frac{d}{dx} \left(x^{\frac{1}{2}} \right) = \frac{1}{2} x^{-\frac{1}{2}}$$
$$= \frac{1}{2\sqrt{x}}$$
And, $\frac{dv}{dt} = \frac{d}{dt} (\cos t) = -\sin t$
$$= -\sin \left(\sqrt{x} \right)$$

By using chain rule, we obtain

$$\frac{dt}{dx} = \frac{dv}{dt} \cdot \frac{dt}{dx}$$
$$= -\sin\left(\sqrt{x}\right) \cdot \frac{1}{2\sqrt{x}}$$
$$= -\frac{1}{2\sqrt{x}}\sin\left(\sqrt{x}\right)$$
$$= -\frac{\sin\left(\sqrt{x}\right)}{2\sqrt{x}}$$

Alternate method

$$\frac{d}{dx} \left[\cos\left(\sqrt{x}\right) \right] = -\sin\left(\sqrt{x}\right) \cdot \frac{d}{dx} \left(\sqrt{x}\right)$$
$$= -\sin\left(\sqrt{x}\right) \times \frac{d}{dx} \left(x^{\frac{1}{2}}\right)$$
$$= -\sin\sqrt{x} \times \frac{1}{2} x^{-\frac{1}{2}}$$
$$= \frac{-\sin\sqrt{x}}{2\sqrt{x}}$$

Question 9:

Prove that the function *f* given by

$$f(x) = |x-1|, x \in \mathbf{R}$$
 is notdifferentiable at $x = 1$.

Answer

The given function is $f(x) = |x-1|, x \in \mathbf{R}$

It is known that a function *f* is differentiable at a point x = c in its domain if both

$$\lim_{h \to 0^-} \frac{f(c+h) - f(c)}{h} \text{ and } \lim_{h \to 0^+} \frac{f(c+h) - f(c)}{h} \text{ are finite and equal.}$$

To check the differentiability of the given function at x = 1,

consider the left hand limit of f at x = 1

$$\lim_{h \to 0^{-}} \frac{f(1+h) - f(1)}{h} = \lim_{h \to 0^{-}} \frac{|1+h-1| - |1-1|}{h}$$
$$= \lim_{h \to 0^{-}} \frac{|h| - 0}{h} = \lim_{h \to 0^{-}} \frac{-h}{h} \qquad (h < 0 \Longrightarrow |h| = -h)$$
$$= -1$$

Consider the right hand limit of f at x = 1

$$\lim_{h \to 0^+} \frac{f(1+h) - f(1)}{h} = \lim_{h \to 0^+} \frac{|1+h-1| - |1-1|}{h}$$
$$= \lim_{h \to 0^+} \frac{|h| - 0}{h} = \lim_{h \to 0^+} \frac{h}{h} \qquad (h > 0 \Longrightarrow |h| = h)$$
$$= 1$$

Since the left and right hand limits of f at x = 1 are not equal, f is not differentiable at x = 1

Question 10:

Prove that the greatest integer function defined by f(x) = [x], 0 < x < 3 is not differentiable at x = 1 and x = 2.

Answer

The given function f is f(x) = [x], 0 < x < 3

It is known that a function *f* is differentiable at a point x = c in its domain if both

$$\lim_{h \to 0^-} \frac{f(c+h) - f(c)}{h} \text{ and } \lim_{h \to 0^+} \frac{f(c+h) - f(c)}{h} \text{ are finite and equal.}$$

To check the differentiability of the given function at x = 1, consider the left hand limit of f at x = 1

$$\lim_{h \to 0^{-}} \frac{f(1+h) - f(1)}{h} = \lim_{h \to 0^{-}} \frac{[1+h] - [1]}{h}$$
$$= \lim_{h \to 0^{-}} \frac{0 - 1}{h} = \lim_{h \to 0^{-}} \frac{-1}{h} = \infty$$

Consider the right hand limit of f at x = 1

$$\lim_{h \to 0^+} \frac{f(1+h) - f(1)}{h} = \lim_{h \to 0^+} \frac{[1+h] - [1]}{h}$$
$$= \lim_{h \to 0^+} \frac{1-1}{h} = \lim_{h \to 0^+} 0 = 0$$

Since the left and right hand limits of f at x = 1 are not equal, f is not differentiable at x = 1

To check the differentiability of the given function at x = 2, consider the left hand limit of f at x = 2

$$\lim_{h \to 0^{-}} \frac{f(2+h) - f(2)}{h} = \lim_{h \to 0^{-}} \frac{[2+h] - [2]}{h}$$
$$= \lim_{h \to 0^{-}} \frac{1-2}{h} = \lim_{h \to 0^{-}} \frac{-1}{h} = \infty$$

Consider the right hand limit of f at x = 1

$$\lim_{h \to 0^+} \frac{f(2+h) - f(2)}{h} = \lim_{h \to 0^+} \frac{[2+h] - [2]}{h}$$
$$= \lim_{h \to 0^+} \frac{2-2}{h} = \lim_{h \to 0^+} 0 = 0$$

Since the left and right hand limits of f at x = 2 are not equal, f is not differentiable at x

Exercise 5.3

Question 1:
$$\frac{dy}{dx}$$
:

 $2x + 3y = \sin x$

Answer

The given relationship is $2x + 3y = \sin x$

Differentiating this relationship with respect to x, we obtain

$$\frac{d}{dx}(2x+3y) = \frac{d}{dx}(\sin x)$$
$$\Rightarrow \frac{d}{dx}(2x) + \frac{d}{dx}(3y) = \cos x$$
$$\Rightarrow 2+3\frac{dy}{dx} = \cos x$$
$$\Rightarrow 3\frac{dy}{dx} = \cos x - 2$$
$$\therefore \frac{dy}{dx} = \frac{\cos x - 2}{3}$$

Question 2:

Find $\frac{dy}{dx}$: $2x + 3y = \sin y$

Answer

The given relationship is $2x + 3y = \sin y$

$$\frac{d}{dx}(2x) + \frac{d}{dx}(3y) = \frac{d}{dx}(\sin y)$$

$$\Rightarrow 2 + 3\frac{dy}{dx} = \cos y \frac{dy}{dx} \qquad [By using chain rule]$$
$$\Rightarrow 2 = (\cos y - 3)\frac{dy}{dx}$$
$$\therefore \frac{dy}{dx} = \frac{2}{\cos y - 3}$$

Question 3:

Find $\frac{dy}{dx}$: $ax + by^2 = \cos y$

Answer

The given relationship is $ax + by^2 = \cos y$

Differentiating this relationship with respect to x, we obtain

$$\frac{d}{dx}(ax) + \frac{d}{dx}(by^{2}) = \frac{d}{dx}(\cos y)$$

$$\Rightarrow a + b\frac{d}{dx}(y^{2}) = \frac{d}{dx}(\cos y) \qquad \dots(1)$$

Using chain rule, we obtain $\frac{d}{dx}(y^{2}) = 2y\frac{dy}{dx}$ and $\frac{d}{dx}(\cos y) = -\sin y\frac{dy}{dx} \qquad \dots(2)$

Using chain rule, we obtain $dx^{(y)} = 2y dx$ and $dx^{(cosy)} = 3my dx$ From (1) and (2), we obtain

$$a + b \times 2y \frac{dy}{dx} = -\sin y \frac{dy}{dx}$$
$$\Rightarrow (2by + \sin y) \frac{dy}{dx} = -a$$
$$\therefore \frac{dy}{dx} = \frac{-a}{2by + \sin y}$$

Question 4:

Find $\frac{dy}{dx}$: $xy + y^2 = \tan x + y$ Answer

The given relationship is $xy + y^2 = \tan x + y$

Differentiating this relationship with respect to x, we obtain

$$\frac{d}{dx}(xy+y^2) = \frac{d}{dx}(\tan x + y)$$

$$\Rightarrow \frac{d}{dx}(xy) + \frac{d}{dx}(y^2) = \frac{d}{dx}(\tan x) + \frac{dy}{dx}$$

$$\Rightarrow \left[y \cdot \frac{d}{dx}(x) + x \cdot \frac{dy}{dx}\right] + 2y \frac{dy}{dx} = \sec^2 x + \frac{dy}{dx}$$

$$\Rightarrow y \cdot 1 + x \cdot \frac{dy}{dx} + 2y \frac{dy}{dx} = \sec^2 x + \frac{dy}{dx}$$

$$\Rightarrow (x + 2y - 1) \frac{dy}{dx} = \sec^2 x - y$$

$$\therefore \frac{dy}{dx} = \frac{\sec^2 x - y}{(x + 2y - 1)}$$

[Using product rule and chain rule]

Question 5:

Find dx: $x^2 + xy + y^2 = 100$

Answer

The given relationship is $x^2 + xy + y^2 = 100$

$$\frac{d}{dx}(x^{2} + xy + y^{2}) = \frac{d}{dx}(100)$$
$$\Rightarrow \frac{d}{dx}(x^{2}) + \frac{d}{dx}(xy) + \frac{d}{dx}(y^{2}) = 0$$
[Derivative of constant function is 0]

$$\Rightarrow 2x + \left[y \cdot \frac{d}{dx} (x) + x \cdot \frac{dy}{dx} \right] + 2y \frac{dy}{dx} = 0$$
$$\Rightarrow 2x + y \cdot 1 + x \cdot \frac{dy}{dx} + 2y \frac{dy}{dx} = 0$$
$$\Rightarrow 2x + y + (x + 2y) \frac{dy}{dx} = 0$$
$$\therefore \frac{dy}{dx} = -\frac{2x + y}{x + 2y}$$
Question 6:

[Using product rule and chain rule]

dy

Find dx:

$$x^3 + x^2y + xy^2 + y^3 = 81$$

Answer

The given relationship is $x^3 + x^2y + xy^2 + y^3 = 81$

Differentiating this relationship with respect to x, we obtain

$$\frac{d}{dx}(x^{3} + x^{2}y + xy^{2} + y^{3}) = \frac{d}{dx}(81)$$

$$\Rightarrow \frac{d}{dx}(x^{3}) + \frac{d}{dx}(x^{2}y) + \frac{d}{dx}(xy^{2}) + \frac{d}{dx}(y^{3}) = 0$$

$$\Rightarrow 3x^{2} + \left[y\frac{d}{dx}(x^{2}) + x^{2}\frac{dy}{dx}\right] + \left[y^{2}\frac{d}{dx}(x) + x\frac{d}{dx}(y^{2})\right] + 3y^{2}\frac{dy}{dx} = 0$$

$$\Rightarrow 3x^{2} + \left[y \cdot 2x + x^{2}\frac{dy}{dx}\right] + \left[y^{2} \cdot 1 + x \cdot 2y \cdot \frac{dy}{dx}\right] + 3y^{2}\frac{dy}{dx} = 0$$

$$\Rightarrow \left(x^{2} + 2xy + 3y^{2}\right)\frac{dy}{dx} + \left(3x^{2} + 2xy + y^{2}\right) = 0$$

$$\therefore \frac{dy}{dx} = \frac{-\left(3x^{2} + 2xy + y^{2}\right)}{\left(x^{2} + 2xy + 3y^{2}\right)}$$

Question 7:

Find $\frac{dy}{dx}$: $\sin^2 y + \cos xy = \pi$ Answer

The given relationship is $\sin^2 y + \cos xy = \pi$

Differentiating this relationship with respect to x, we obtain

$$\frac{d}{dx}(\sin^2 y + \cos xy) = \frac{d}{dx}(\pi)$$
$$\Rightarrow \frac{d}{dx}(\sin^2 y) + \frac{d}{dx}(\cos xy) = 0 \qquad \dots(1)$$

Using chain rule, we obtain

$$\frac{d}{dx}(\sin^2 y) = 2\sin y \frac{d}{dx}(\sin y) = 2\sin y \cos y \frac{dy}{dx} \qquad \dots (2)$$
$$\frac{d}{dx}(\cos xy) = -\sin xy \frac{d}{dx}(xy) = -\sin xy \left[y \frac{d}{dx}(x) + x \frac{dy}{dx} \right]$$
$$= -\sin xy \left[y \cdot 1 + x \frac{dy}{dx} \right] = -y \sin xy - x \sin xy \frac{dy}{dx} \qquad \dots (3)$$

From (1), (2), and (3), we obtain

$$2\sin y \cos y \frac{dy}{dx} - y \sin xy - x \sin xy \frac{dy}{dx} = 0$$

$$\Rightarrow (2\sin y \cos y - x \sin xy) \frac{dy}{dx} = y \sin xy$$

$$\Rightarrow (\sin 2y - x \sin xy) \frac{dy}{dx} = y \sin xy$$

$$\therefore \frac{dy}{dx} = \frac{y \sin xy}{\sin 2y - x \sin xy}$$

Question 8:

Find $\frac{dy}{dx}$: $\sin^2 x + \cos^2 y = 1$ Answer

The given relationship is $\sin^2 x + \cos^2 y = 1$

$$\frac{d}{dx} \left(\sin^2 x + \cos^2 y \right) = \frac{d}{dx} (1)$$

$$\Rightarrow \frac{d}{dx} \left(\sin^2 x \right) + \frac{d}{dx} \left(\cos^2 y \right) = 0$$

$$\Rightarrow 2 \sin x \cdot \frac{d}{dx} (\sin x) + 2 \cos y \cdot \frac{d}{dx} (\cos y) = 0$$

$$\Rightarrow 2 \sin x \cos x + 2 \cos y (-\sin y) \cdot \frac{dy}{dx} = 0$$

$$\Rightarrow \sin 2x - \sin 2y \frac{dy}{dx} = 0$$

$$\therefore \frac{dy}{dx} = \frac{\sin 2x}{\sin 2y}$$

Question 9:

Find $\frac{dy}{dx}$:

$$y = \sin^{-1}\left(\frac{2x}{1+x^2}\right)$$

Answer

$$y = \sin^{-1}\left(\frac{2x}{1+x^2}\right)$$

The given relationship is

$$y = \sin^{-1} \left(\frac{2x}{1 + x^2} \right)$$
$$\Rightarrow \sin y = \frac{2x}{1 + x^2}$$

Differentiating this relationship with respect to x, we obtain

$$\frac{d}{dx}(\sin y) = \frac{d}{dx}\left(\frac{2x}{1+x^2}\right)$$
$$\Rightarrow \cos y \frac{dy}{dx} = \frac{d}{dx}\left(\frac{2x}{1+x^2}\right) \qquad \dots(1)$$

The function, $\frac{2x}{1+x^2}$, is of the form of $\frac{u}{v}$. Therefore, by quotient rule, we obtain

$$\frac{d}{dx}\left(\frac{2x}{1+x^2}\right) = \frac{\left(1+x^2\right) \cdot \frac{d}{dx}(2x) - 2x \cdot \frac{d}{dx}(1+x^2)}{\left(1+x^2\right)^2}$$
$$= \frac{\left(1+x^2\right) \cdot 2 - 2x \cdot \left[0+2x\right]}{\left(1+x^2\right)^2} = \frac{2+2x^2-4x^2}{\left(1+x^2\right)^2} = \frac{2\left(1-x^2\right)}{\left(1+x^2\right)^2} \qquad \dots (2)$$

Also, $\sin y = \frac{2x}{1+x^2}$

$$\Rightarrow \cos y = \sqrt{1 - \sin^2 y} = \sqrt{1 - \left(\frac{2x}{1 + x^2}\right)^2} = \sqrt{\frac{\left(1 + x^2\right)^2 - 4x^2}{\left(1 + x^2\right)^2}} = \sqrt{\frac{\left(1 - x^2\right)^2}{\left(1 + x^2\right)^2}} = \frac{1 - x^2}{1 + x^2} \qquad \dots (3)$$

From (1), (2), and (3), we obtain

$$\frac{1-x^2}{1+x^2} \times \frac{dy}{dx} = \frac{2(1-x^2)}{(1+x^2)^2}$$
$$\Rightarrow \frac{dy}{dx} = \frac{2}{1+x^2}$$

Question 10:

Find
$$\frac{dy}{dx}$$
:
 $y = \tan^{-1} \left(\frac{3x - x^3}{1 - 3x^2} \right), -\frac{1}{\sqrt{3}} < x < \frac{1}{\sqrt{3}}$

Answer

$$y = \tan^{-1} \left(\frac{3x - x^3}{1 - 3x^2} \right)$$
 The given relationship is

$$y = \tan^{-1} \left(\frac{3x - x^3}{1 - 3x^2} \right)$$
$$\Rightarrow \tan y = \frac{3x - x^3}{1 - 3x^2} \qquad \dots (1)$$

$$\tan y = \frac{3\tan\frac{y}{3} - \tan^3\frac{y}{3}}{1 - 3\tan^2\frac{y}{3}} \qquad \dots (2)$$

It is known that,

Comparing equations (1) and (2), we obtain

$$x = \tan \frac{y}{3}$$

Differentiating this relationship with respect to x, we obtain

$$\frac{d}{dx}(x) = \frac{d}{dx}\left(\tan\frac{y}{3}\right)$$
$$\Rightarrow 1 = \sec^2\frac{y}{3} \cdot \frac{d}{dx}\left(\frac{y}{3}\right)$$
$$\Rightarrow 1 = \sec^2\frac{y}{3} \cdot \frac{1}{3} \cdot \frac{dy}{dx}$$
$$\Rightarrow \frac{dy}{dx} = \frac{3}{\sec^2\frac{y}{3}} = \frac{3}{1 + \tan^2\frac{y}{3}}$$
$$\therefore \frac{dy}{dx} = \frac{3}{1 + x^2}$$

Question 11:

Find
$$\frac{dy}{dx}$$
:

$$y = \cos^{-1}\left(\frac{1 - x^2}{1 + x^2}\right), 0 < x < 1$$

Answer

The given relationship is,

$$y = \cos^{-1} \left(\frac{1 - x^2}{1 + x^2} \right)$$
$$\Rightarrow \cos y = \frac{1 - x^2}{1 + x^2}$$
$$\Rightarrow \frac{1 - \tan^2 \frac{y}{2}}{1 + \tan^2 \frac{y}{2}} = \frac{1 - x^2}{1 + x^2}$$

On comparing L.H.S. and R.H.S. of the above relationship, we obtain

$$\tan\frac{y}{2} = x$$

Differentiating this relationship with respect to x, we obtain

$$\sec^{2} \frac{y}{2} \cdot \frac{d}{dx} \left(\frac{y}{2} \right) = \frac{d}{dx} (x)$$
$$\Rightarrow \sec^{2} \frac{y}{2} \times \frac{1}{2} \frac{dy}{dx} = 1$$
$$\Rightarrow \frac{dy}{dx} = \frac{2}{\sec^{2} \frac{y}{2}}$$
$$\Rightarrow \frac{dy}{dx} = \frac{2}{1 + \tan^{2} \frac{y}{2}}$$
$$\therefore \frac{dy}{dx} = \frac{1}{1 + x^{2}}$$

Question 12:

Find
$$\frac{dy}{dx}$$
:

$$y = \sin^{-1}\left(\frac{1-x^2}{1+x^2}\right), \ 0 < x < 1$$

Answer

$$y = \sin^{-1} \left(\frac{1 - x^2}{1 + x^2} \right)$$

The given relationship is

$$y = \sin^{-1} \left(\frac{1 - x^2}{1 + x^2} \right)$$
$$\Rightarrow \sin y = \frac{1 - x^2}{1 + x^2}$$

Differentiating this relationship with respect to x, we obtain

$$\frac{d}{dx}(\sin y) = \frac{d}{dx}\left(\frac{1-x^2}{1+x^2}\right) \qquad \dots(1)$$

Using chain rule, we obtain

$$\frac{d}{dx}(\sin y) = \cos y \cdot \frac{dy}{dx}$$

$$\cos y = \sqrt{1 - \sin^2 y} = \sqrt{1 - \left(\frac{1 - x^2}{1 + x^2}\right)^2}$$

$$= \sqrt{\frac{\left(1 + x^2\right)^2 - \left(1 - x^2\right)^2}{\left(1 + x^2\right)^2}} = \sqrt{\frac{4x^2}{\left(1 + x^2\right)^2}} = \frac{2x}{1 + x^2}$$

$$\therefore \frac{d}{dx}(\sin y) = \frac{2x}{1 + x^2} \frac{dy}{dx} \qquad \dots(2)$$

$$\frac{d}{dx}\left(\frac{1 - x^2}{1 + x^2}\right) = \frac{\left(1 + x^2\right) \cdot \left(1 - x^2\right)' - \left(1 - x^2\right) \cdot \left(1 + x^2\right)'}{\left(1 + x^2\right)^2}$$

$$= \frac{\left(1 + x^2\right)\left(-2x\right) - \left(1 - x^2\right) \cdot \left(2x\right)}{\left(1 + x^2\right)^2}$$

$$= \frac{-2x - 2x^3 - 2x + 2x^3}{\left(1 + x^2\right)^2}$$

$$= \frac{-4x}{\left(1 + x^2\right)^2} \qquad \dots(3)$$

[Using quotient rule]

From (1), (2), and (3), we obtain

$$\frac{2x}{1+x^2}\frac{dy}{dx} = \frac{-4x}{\left(1+x^2\right)^2}$$
$$\Rightarrow \frac{dy}{dx} = \frac{-2}{1+x^2}$$

Alternate method

$$y = \sin^{-1} \left(\frac{1 - x^2}{1 + x^2} \right)$$
$$\Rightarrow \sin y = \frac{1 - x^2}{1 + x^2}$$

$$\Rightarrow (1+x^{2}) \sin y = 1-x^{2}$$

$$\Rightarrow (1+\sin y)x^{2} = 1-\sin y$$

$$\Rightarrow x^{2} = \frac{1-\sin y}{1+\sin y}$$

$$\Rightarrow x^{2} = \frac{\left(\cos \frac{y}{2} - \sin \frac{y}{2}\right)^{2}}{\left(\cos \frac{y}{2} + \sin \frac{y}{2}\right)^{2}}$$

$$\Rightarrow x = \frac{\cos \frac{y}{2} - \sin \frac{y}{2}}{\cos \frac{y}{2} + \sin \frac{y}{2}}$$

$$\Rightarrow x = \frac{1-\tan \frac{y}{2}}{1+\tan \frac{y}{2}}$$

$$\Rightarrow x = \tan\left(\frac{\pi}{4} - \frac{y}{2}\right)$$

$$\frac{d}{dx}(x) = \frac{d}{dx} \cdot \left[\tan\left(\frac{\pi}{4} - \frac{y}{2}\right) \right]$$
$$\Rightarrow 1 = \sec^2 \left(\frac{\pi}{4} - \frac{y}{2}\right) \cdot \frac{d}{dx} \left(\frac{\pi}{4} - \frac{y}{2}\right)$$
$$\Rightarrow 1 = \left[1 + \tan^2 \left(\frac{\pi}{4} - \frac{y}{2}\right) \right] \cdot \left(-\frac{1}{2} \frac{dy}{dx}\right)$$
$$\Rightarrow 1 = \left(1 + x^2\right) \left(-\frac{1}{2} \frac{dy}{dx}\right)$$
$$\Rightarrow \frac{dy}{dx} = \frac{-2}{1 + x^2}$$

Question 13:

$$\frac{dy}{dx}$$

Find dx:

$$y = \cos^{-1}\left(\frac{2x}{1+x^2}\right), -1 < x < 1$$

Answer

$$y = \cos^{-1}\left(\frac{2x}{1+x^2}\right)$$

The given relationship is
$$(2\pi)$$

$$y = \cos^{-1}\left(\frac{2x}{1+x^2}\right)$$
$$\Rightarrow \cos y = \frac{2x}{1+x^2}$$

$$\frac{d}{dx}(\cos y) = \frac{d}{dx} \cdot \left(\frac{2x}{1+x^2}\right)$$
$$\Rightarrow -\sin y \cdot \frac{dy}{dx} = \frac{\left(1+x^2\right) \cdot \frac{d}{dx}(2x) - 2x \cdot \frac{d}{dx}\left(1+x^2\right)}{\left(1+x^2\right)^2}$$

$$\Rightarrow -\sqrt{1 - \cos^2 y} \frac{dy}{dx} = \frac{(1 + x^2) \times 2 - 2x \cdot 2x}{(1 + x^2)^2}$$
$$\Rightarrow \left[\sqrt{1 - \left(\frac{2x}{1 + x^2}\right)^2} \right] \frac{dy}{dx} = -\left[\frac{2(1 - x^2)}{(1 + x^2)^2}\right]$$
$$\Rightarrow \sqrt{\frac{(1 + x^2)^2 - 4x^2}{(1 + x^2)^2}} \frac{dy}{dx} = \frac{-2(1 - x^2)}{(1 + x^2)^2}$$
$$\Rightarrow \sqrt{\frac{(1 - x^2)^2}{(1 + x^2)^2}} \frac{dy}{dx} = \frac{-2(1 - x^2)}{(1 + x^2)^2}$$
$$\Rightarrow \frac{1 - x^2}{1 + x^2} \cdot \frac{dy}{dx} = \frac{-2(1 - x^2)}{(1 + x^2)^2}$$
$$\Rightarrow \frac{1 - x^2}{1 + x^2} \cdot \frac{dy}{dx} = \frac{-2(1 - x^2)}{(1 + x^2)^2}$$
$$\Rightarrow \frac{dy}{dx} = \frac{-2}{1 + x^2}$$

Question 14:

Find
$$\frac{dy}{dx}$$
:

$$y = \sin^{-1}\left(2x\sqrt{1-x^2}\right), \ -\frac{1}{\sqrt{2}} < x < \frac{1}{\sqrt{2}}$$

Answer

$$y = \sin^{-1} \left(2x\sqrt{1-x^2} \right)$$

$$y = \sin^{-1} \left(2x\sqrt{1-x^2} \right)$$

$$\Rightarrow \sin y = 2x\sqrt{1-x^2}$$

$$\cos y \frac{dy}{dx} = 2 \left[x \frac{d}{dx} \left(\sqrt{1 - x^2} \right) + \sqrt{1 - x^2} \frac{dx}{dx} \right]$$

$$\Rightarrow \sqrt{1 - \sin^2 y} \frac{dy}{dx} = 2 \left[\frac{x}{2} \cdot \frac{-2x}{\sqrt{1 - x^2}} + \sqrt{1 - x^2} \right]$$

$$\Rightarrow \sqrt{1 - \left(2x\sqrt{1 - x^2} \right)^2} \frac{dy}{dx} = 2 \left[\frac{-x^2 + 1 - x^2}{\sqrt{1 - x^2}} \right]$$

$$\Rightarrow \sqrt{1 - 4x^2 \left(1 - x^2 \right)} \frac{dy}{dx} = 2 \left[\frac{1 - 2x^2}{\sqrt{1 - x^2}} \right]$$

$$\Rightarrow \sqrt{\left(1 - 2x^2 \right)^2} \frac{dy}{dx} = 2 \left[\frac{1 - 2x^2}{\sqrt{1 - x^2}} \right]$$

$$\Rightarrow \left(1 - 2x^2 \right) \frac{dy}{dx} = 2 \left[\frac{1 - 2x^2}{\sqrt{1 - x^2}} \right]$$

$$\Rightarrow \frac{dy}{dx} = \frac{2}{\sqrt{1 - x^2}}$$

Question 15:

Find $\frac{dy}{dx}$:

$$y = \sec^{-1}\left(\frac{1}{2x^2 - 1}\right), 0 < x < \frac{1}{\sqrt{2}}$$

Answer

 $y = \sec^{-1} \left(\frac{1}{2x^2 - 1} \right)$ The given relationship is

$$y = \sec^{-1}\left(\frac{1}{2x^2 - 1}\right)$$

$$\Rightarrow \sec y = \frac{1}{2x^2 - 1}$$
$$\Rightarrow \cos y = 2x^2 - 1$$
$$\Rightarrow 2x^2 = 1 + \cos y$$
$$\Rightarrow 2x^2 = 2\cos^2 \frac{y}{2}$$
$$\Rightarrow x = \cos \frac{y}{2}$$

$$\frac{d}{dx}(x) = \frac{d}{dx}\left(\cos\frac{y}{2}\right)$$
$$\Rightarrow 1 = -\sin\frac{y}{2} \cdot \frac{d}{dx}\left(\frac{y}{2}\right)$$
$$\Rightarrow \frac{-1}{\sin\frac{y}{2}} = \frac{1}{2}\frac{dy}{dx}$$
$$\Rightarrow \frac{dy}{dx} = \frac{-2}{\sin\frac{y}{2}} = \frac{-2}{\sqrt{1 - \cos^2\frac{y}{2}}}$$
$$\Rightarrow \frac{dy}{dx} = \frac{-2}{\sqrt{1 - x^2}}$$

Exercise 5.4

Question 1:

Differentiate the following w.r.t. x:

 $\frac{e^x}{\sin x}$

Answer

$$y = \frac{e^x}{\sin x}$$

By using the quotient rule, we obtain

$$\frac{dy}{dx} = \frac{\sin x \frac{d}{dx} (e^x) - e^x \frac{d}{dx} (\sin x)}{\sin^2 x}$$
$$= \frac{\sin x \cdot (e^x) - e^x \cdot (\cos x)}{\sin^2 x}$$
$$= \frac{e^x (\sin x - \cos x)}{\sin^2 x}, x \neq n\pi, n \in \mathbb{Z}$$

Question 2:

Differentiate the following w.r.t. x:

 $e^{\sin^{-1}x}$

Answer

Let $y = e^{\sin^{-1}x}$

By using the chain rule, we obtain

$$\frac{dy}{dx} = \frac{d}{dx} \left(e^{\sin^{-1}x} \right)$$
$$\Rightarrow \frac{dy}{dx} = e^{\sin^{-1}x} \cdot \frac{d}{dx} \left(\sin^{-1}x \right)$$
$$= e^{\sin^{-1}x} \cdot \frac{1}{\sqrt{1 - x^2}}$$
$$= \frac{e^{\sin^{-1}x}}{\sqrt{1 - x^2}}$$
$$\therefore \frac{dy}{dx} = \frac{e^{\sin^{-1}x}}{\sqrt{1 - x^2}}, x \in (-1, 1)$$

Question 2:

Show that the function given by $f(x) = e^{2x}$ is strictly increasing on **R**. Answer

Let x_1 and x_2 be any two numbers in **R**.

Then, we have:

$$x_1 < x_2 \Longrightarrow 2x_1 < 2x_2 \Longrightarrow e^{2x_1} < e^{2x_2} \Longrightarrow f(x_1) < f(x_2)$$

Hence, f is strictly increasing on **R**.

Question 3:

Differentiate the following w.r.t. x:

 e^{x^3}

Answer

Let $y = e^{x^3}$

By using the chain rule, we obtain

$$\frac{dy}{dx} = \frac{d}{dx}\left(e^{x^3}\right) = e^{x^3} \cdot \frac{d}{dx}\left(x^3\right) = e^{x^3} \cdot 3x^2 = 3x^2 e^{x^3}$$

Question 4: Differentiate the following w.r.t. x: $sin(tan^{-1}e^{-x})$ Answer

$$\int_{\text{Let}} y = \sin\left(\tan^{-1}e^{-x}\right)$$

By using the chain rule, we obtain

$$\frac{dy}{dx} = \frac{d}{dx} \left[\sin\left(\tan^{-1}e^{-x}\right) \right]$$

= $\cos\left(\tan^{-1}e^{-x}\right) \cdot \frac{d}{dx} \left(\tan^{-1}e^{-x}\right)$
= $\cos\left(\tan^{-1}e^{-x}\right) \cdot \frac{1}{1 + \left(e^{-x}\right)^2} \cdot \frac{d}{dx} \left(e^{-x}\right)$
= $\frac{\cos\left(\tan^{-1}e^{-x}\right)}{1 + e^{-2x}} \cdot e^{-x} \cdot \frac{d}{dx} \left(-x\right)$
= $\frac{e^{-x}\cos\left(\tan^{-1}e^{-x}\right)}{1 + e^{-2x}} \times (-1)$
= $\frac{-e^{-x}\cos\left(\tan^{-1}e^{-x}\right)}{1 + e^{-2x}}$

Question 5:

Differentiate the following w.r.t. x:

 $\log(\cos e^x)$

Answer

Let $y = \log(\cos e^x)$

By using the chain rule, we obtain

$$\frac{dy}{dx} = \frac{d}{dx} \Big[\log(\cos e^x) \Big]$$
$$= \frac{1}{\cos e^x} \cdot \frac{d}{dx} (\cos e^x)$$
$$= \frac{1}{\cos e^x} \cdot (-\sin e^x) \cdot \frac{d}{dx} (e^x)$$
$$= \frac{-\sin e^x}{\cos e^x} \cdot e^x$$
$$= -e^x \tan e^x, e^x \neq (2n+1)\frac{\pi}{2}, n \in \mathbf{N}$$

Question 6:

Differentiate the following w.r.t. x:

 $e^{x} + e^{x^{2}} + \dots + e^{x^{5}}$

Answer

$$\begin{aligned} &\frac{d}{dx} \left(e^{x} + e^{x^{2}} + \dots + e^{x^{5}} \right) \\ &= \frac{d}{dx} \left(e^{x} \right) + \frac{d}{dx} \left(e^{x^{2}} \right) + \frac{d}{dx} \left(e^{x^{3}} \right) + \frac{d}{dx} \left(e^{x^{4}} \right) + \frac{d}{dx} \left(e^{x^{5}} \right) \\ &= e^{x} + \left[e^{x^{2}} \times \frac{d}{dx} \left(x^{2} \right) \right] + \left[e^{x^{3}} \cdot \frac{d}{dx} \left(x^{3} \right) \right] + \left[e^{x^{4}} \cdot \frac{d}{dx} \left(x^{4} \right) \right] + \left[e^{x^{5}} \cdot \frac{d}{dx} \left(x^{5} \right) \right] \\ &= e^{x} + \left(e^{x^{2}} \times 2x \right) + \left(e^{x^{3}} \times 3x^{2} \right) + \left(e^{x^{4}} \times 4x^{3} \right) + \left(e^{x^{5}} \times 5x^{4} \right) \\ &= e^{x} + 2xe^{x^{2}} + 3x^{2}e^{x^{3}} + 4x^{3}e^{x^{4}} + 5x^{4}e^{x^{5}} \end{aligned}$$

Question 7:

Differentiate the following w.r.t. x:

$$\sqrt{e^{\sqrt{x}}}, x > 0$$

Answer

Let
$$y = \sqrt{e^{\sqrt{x}}}$$

Then, $y^2 = e^{\sqrt{x}}$

$$y^{2} = e^{\sqrt{x}}$$

$$\Rightarrow 2y \frac{dy}{dx} = e^{\sqrt{x}} \frac{d}{dx} (\sqrt{x})$$

$$\Rightarrow 2y \frac{dy}{dx} = e^{\sqrt{x}} \frac{1}{2} \cdot \frac{1}{\sqrt{x}}$$

$$\Rightarrow \frac{dy}{dx} = \frac{e^{\sqrt{x}}}{4y\sqrt{x}}$$

$$\Rightarrow \frac{dy}{dx} = \frac{e^{\sqrt{x}}}{4\sqrt{e^{\sqrt{x}}}\sqrt{x}}$$

$$\Rightarrow \frac{dy}{dx} = \frac{e^{\sqrt{x}}}{4\sqrt{e^{\sqrt{x}}}}, x > 0$$

[By applying the chain rule]

Question 8:

Differentiate the following w.r.t. x:

$$\log(\log x), x > 1$$

Answer

Let
$$y = \log(\log x)$$

By using the chain rule, we obtain

$$\frac{dy}{dx} = \frac{d}{dx} \left[\log(\log x) \right]$$
$$= \frac{1}{\log x} \cdot \frac{d}{dx} (\log x)$$
$$= \frac{1}{\log x} \cdot \frac{1}{x}$$
$$= \frac{1}{x \log x}, x > 1$$

Question 9:

Differentiate the following w.r.t. x:

 $\frac{\cos x}{\log x}, x > 0$

Answer

 $y = \frac{\cos x}{\log x}$

By using the quotient rule, we obtain

$$\frac{dy}{dx} = \frac{\frac{d}{dx}(\cos x) \times \log x - \cos x \times \frac{d}{dx}(\log x)}{(\log x)^2}$$
$$= \frac{-\sin x \log x - \cos x \times \frac{1}{x}}{(\log x)^2}$$
$$= \frac{-[x \log x . \sin x + \cos x]}{x(\log x)^2}, x > 0$$

Question 10:

Differentiate the following w.r.t. x:

$$\cos\left(\log x + e^x\right), x > 0$$

Answer

$$\int_{\text{Let}} y = \cos\left(\log x + e^x\right)$$

By using the chain rule, we obtain

$$\frac{dy}{dx} = -\sin\left(\log x + e^x\right) \cdot \frac{d}{dx} \left(\log x + e^x\right)$$
$$= -\sin\left(\log x + e^x\right) \cdot \left[\frac{d}{dx} \left(\log x\right) + \frac{d}{dx} \left(e^x\right)\right]$$
$$= -\sin\left(\log x + e^x\right) \cdot \left(\frac{1}{x} + e^x\right)$$
$$= -\left(\frac{1}{x} + e^x\right) \sin\left(\log x + e^x\right), x > 0$$

Question 1:

Differentiate the function with respect to *x*.

 $\cos x \cdot \cos 2x \cdot \cos 3x$

Answer

Let $y = \cos x \cdot \cos 2x \cdot \cos 3x$

Taking logarithm on both the sides, we obtain

 $\log y = \log(\cos x . \cos 2x . \cos 3x)$ $\Rightarrow \log y = \log(\cos x) + \log(\cos 2x) + \log(\cos 3x)$

Differentiating both sides with respect to x, we obtain

$$\frac{1}{y}\frac{dy}{dx} = \frac{1}{\cos x} \cdot \frac{d}{dx}(\cos x) + \frac{1}{\cos 2x} \cdot \frac{d}{dx}(\cos 2x) + \frac{1}{\cos 3x} \cdot \frac{d}{dx}(\cos 3x)$$
$$\Rightarrow \frac{dy}{dx} = y \left[-\frac{\sin x}{\cos x} - \frac{\sin 2x}{\cos 2x} \cdot \frac{d}{dx}(2x) - \frac{\sin 3x}{\cos 3x} \cdot \frac{d}{dx}(3x) \right]$$
$$\therefore \frac{dy}{dx} = -\cos x \cdot \cos 2x \cdot \cos 3x \left[\tan x + 2\tan 2x + 3\tan 3x \right]$$

Question 2:

Differentiate the function with respect to *x*.

$$\sqrt{\frac{(x-1)(x-2)}{(x-3)(x-4)(x-5)}}$$

Answer

Let
$$y = \sqrt{\frac{(x-1)(x-2)}{(x-3)(x-4)(x-5)}}$$

Taking logarithm on both the sides, we obtain

$$\log y = \log \sqrt{\frac{(x-1)(x-2)}{(x-3)(x-4)(x-5)}}$$

$$\Rightarrow \log y = \frac{1}{2} \log \left[\frac{(x-1)(x-2)}{(x-3)(x-4)(x-5)} \right]$$

$$\Rightarrow \log y = \frac{1}{2} \left[\log \{ (x-1)(x-2) \} - \log \{ (x-3)(x-4)(x-5) \} \right]$$

$$\Rightarrow \log y = \frac{1}{2} \left[\log (x-1) + \log (x-2) - \log (x-3) - \log (x-4) - \log (x-5) \right]$$

Differentiating both sides with respect to x, we obtain

$$\frac{1}{y}\frac{dy}{dx} = \frac{1}{2} \begin{bmatrix} \frac{1}{x-1} \cdot \frac{d}{dx}(x-1) + \frac{1}{x-2} \cdot \frac{d}{dx}(x-2) - \frac{1}{x-3} \cdot \frac{d}{dx}(x-3) \\ -\frac{1}{x-4} \cdot \frac{d}{dx}(x-4) - \frac{1}{x-5} \cdot \frac{d}{dx}(x-5) \end{bmatrix}$$
$$\Rightarrow \frac{dy}{dx} = \frac{y}{2} \left(\frac{1}{x-1} + \frac{1}{x-2} - \frac{1}{x-3} - \frac{1}{x-4} - \frac{1}{x-5} \right)$$
$$\therefore \frac{dy}{dx} = \frac{1}{2} \sqrt{\frac{(x-1)(x-2)}{(x-3)(x-4)(x-5)}} \left[\frac{1}{x-1} + \frac{1}{x-2} - \frac{1}{x-3} - \frac{1}{x-4} - \frac{1}{x-5} \right]$$

Question 3:

Differentiate the function with respect to x.

 $(\log x)^{\cos x}$

Answer

Let
$$y = (\log x)^{\cos x}$$

Taking logarithm on both the sides, we obtain

$$\log y = \cos x \cdot \log \left(\log x \right)$$

Differentiating both sides with respect to x, we obtain

$$\frac{1}{y} \cdot \frac{dy}{dx} = \frac{d}{dx} (\cos x) \times \log(\log x) + \cos x \times \frac{d}{dx} [\log(\log x)]$$
$$\Rightarrow \frac{1}{y} \cdot \frac{dy}{dx} = -\sin x \log(\log x) + \cos x \times \frac{1}{\log x} \cdot \frac{d}{dx} (\log x)$$
$$\Rightarrow \frac{dy}{dx} = y \left[-\sin x \log(\log x) + \frac{\cos x}{\log x} \times \frac{1}{x} \right]$$
$$\therefore \frac{dy}{dx} = (\log x)^{\cos x} \left[\frac{\cos x}{x \log x} - \sin x \log(\log x) \right]$$

Differentiate the function with respect to x.

$$x^{x} - 2^{\sin x}$$

Answer

Let
$$y = x^{x} - 2^{\sin x}$$

Also, let $x^{x} = u$ and $2^{\sin x} = v$
 $\therefore y = u - v$
 $\Rightarrow \frac{dy}{dx} = \frac{du}{dx} - \frac{dv}{dx}$
 $u = x^{x}$

Taking logarithm on both the sides, we obtain

$$\log u = x \log x$$

Differentiating both sides with respect to x, we obtain

$$\frac{1}{u}\frac{du}{dx} = \left[\frac{d}{dx}(x) \times \log x + x \times \frac{d}{dx}(\log x)\right]$$
$$\Rightarrow \frac{du}{dx} = u\left[1 \times \log x + x \times \frac{1}{x}\right]$$
$$\Rightarrow \frac{du}{dx} = x^{x}(\log x + 1)$$
$$\Rightarrow \frac{du}{dx} = x^{x}(1 + \log x)$$
$$v = 2^{\sin x}$$

Taking logarithm on both the sides with respect to x, we obtain

 $\log v = \sin x \cdot \log 2$

Differentiating both sides with respect to x, we obtain

$$\frac{1}{v} \cdot \frac{dv}{dx} = \log 2 \cdot \frac{d}{dx} (\sin x)$$
$$\Rightarrow \frac{dv}{dx} = v \log 2 \cos x$$
$$\Rightarrow \frac{dv}{dx} = 2^{\sin x} \cos x \log 2$$
$$\therefore \frac{dy}{dx} = x^x (1 + \log x) - 2^{\sin x} \cos x \log 2$$

Question 5:

Differentiate the function with respect to x.

$$(x+3)^{2}.(x+4)^{3}.(x+5)^{4}$$

Answer

Let
$$y = (x+3)^2 \cdot (x+4)^3 \cdot (x+5)^4$$

Taking logarithm on both the sides, we obtain

$$\log y = \log(x+3)^{2} + \log(x+4)^{3} + \log(x+5)^{4}$$

$$\Rightarrow \log y = 2\log(x+3) + 3\log(x+4) + 4\log(x+5)$$

$$\frac{1}{y} \cdot \frac{dy}{dx} = 2 \cdot \frac{1}{x+3} \cdot \frac{d}{dx} (x+3) + 3 \cdot \frac{1}{x+4} \cdot \frac{d}{dx} (x+4) + 4 \cdot \frac{1}{x+5} \cdot \frac{d}{dx} (x+5)$$

$$\Rightarrow \frac{dy}{dx} = y \left[\frac{2}{x+3} + \frac{3}{x+4} + \frac{4}{x+5} \right]$$

$$\Rightarrow \frac{dy}{dx} = (x+3)^2 (x+4)^3 (x+5)^4 \cdot \left[\frac{2}{x+3} + \frac{3}{x+4} + \frac{4}{x+5} \right]$$

$$\Rightarrow \frac{dy}{dx} = (x+3)^2 (x+4)^3 (x+5)^4 \cdot \left[\frac{2(x+4)(x+5) + 3(x+3)(x+5) + 4(x+3)(x+4)}{(x+3)(x+4)(x+5)} \right]$$

$$\Rightarrow \frac{dy}{dx} = (x+3)(x+4)^2 (x+5)^3 \cdot \left[2(x^2 + 9x + 20) + 3(x^2 + 8x + 15) + 4(x^2 + 7x + 12) \right]$$

$$\therefore \frac{dy}{dx} = (x+3)(x+4)^2 (x+5)^3 (9x^2 + 70x + 133)$$

Question 6:

Differentiate the function with respect to *x*.

$$\left(x+\frac{1}{x}\right)^x + x^{\left(1+\frac{1}{x}\right)}$$

Answer

Let
$$y = \left(x + \frac{1}{x}\right)^x + x^{\left(1 + \frac{1}{x}\right)}$$

Also, let $u = \left(x + \frac{1}{x}\right)^x$ and $v = x^{\left(1 + \frac{1}{x}\right)}$
 $\therefore y = u + v$
 $\Rightarrow \frac{dy}{dx} = \frac{du}{dx} + \frac{dv}{dx}$...(1)
Then, $u = \left(x + \frac{1}{x}\right)^x$
 $\Rightarrow \log u = \log\left(x + \frac{1}{x}\right)^x$
 $\Rightarrow \log u = x \log\left(x + \frac{1}{x}\right)$

$$\frac{1}{u} \cdot \frac{du}{dx} = \frac{d}{dx} (x) \times \log\left(x + \frac{1}{x}\right) + x \times \frac{d}{dx} \left[\log\left(x + \frac{1}{x}\right)\right]$$

$$\Rightarrow \frac{1}{u} \frac{du}{dx} = 1 \times \log\left(x + \frac{1}{x}\right) + x \times \frac{1}{\left(x + \frac{1}{x}\right)} \cdot \frac{d}{dx} \left(x + \frac{1}{x}\right)$$

$$\Rightarrow \frac{du}{dx} = u \left[\log\left(x + \frac{1}{x}\right) + \frac{x}{\left(x + \frac{1}{x}\right)} \times \left(1 - \frac{1}{x^2}\right)\right]$$

$$\Rightarrow \frac{du}{dx} = \left(x + \frac{1}{x}\right)^x \left[\log\left(x + \frac{1}{x}\right) + \frac{\left(x - \frac{1}{x}\right)}{\left(x + \frac{1}{x}\right)}\right]$$

$$\Rightarrow \frac{du}{dx} = \left(x + \frac{1}{x}\right)^x \left[\log\left(x + \frac{1}{x}\right) + \frac{x^2 - 1}{x^2 + 1}\right]$$

$$\Rightarrow \frac{du}{dx} = \left(x + \frac{1}{x}\right)^x \left[\frac{x^2 - 1}{x^2 + 1} + \log\left(x + \frac{1}{x}\right)\right] \qquad \dots (2)$$

$$v = x^{\left(1 + \frac{1}{x}\right)}$$

$$\Rightarrow \log v = \log\left[x^{\left(1 + \frac{1}{x}\right)}\right]$$

$$\frac{1}{v} \cdot \frac{dv}{dx} = \left[\frac{d}{dx}\left(1 + \frac{1}{x}\right)\right] \times \log x + \left(1 + \frac{1}{x}\right) \cdot \frac{d}{dx} \log x$$
$$\Rightarrow \frac{1}{v} \frac{dv}{dx} = \left(-\frac{1}{x^2}\right) \log x + \left(1 + \frac{1}{x}\right) \cdot \frac{1}{x}$$
$$\Rightarrow \frac{1}{v} \frac{dv}{dx} = -\frac{\log x}{x^2} + \frac{1}{x} + \frac{1}{x^2}$$
$$\Rightarrow \frac{dv}{dx} = v \left[\frac{-\log x + x + 1}{x^2}\right]$$
$$\Rightarrow \frac{dv}{dx} = x^{\left(1 + \frac{1}{x}\right)} \left(\frac{x + 1 - \log x}{x^2}\right) \qquad \dots(3)$$

Therefore, from (1), (2), and (3), we obtain

$$\frac{dy}{dx} = \left(x + \frac{1}{x}\right)^{x} \left[\frac{x^{2} - 1}{x^{2} + 1} + \log\left(x + \frac{1}{x}\right)\right] + x^{\left(1 + \frac{1}{x}\right)} \left(\frac{x + 1 - \log x}{x^{2}}\right)$$

Question 7:

Differentiate the function with respect to x.

$$(\log x)^{x} + x^{\log x}$$
Answer
Let $y = (\log x)^{x} + x^{\log x}$
Also, let $u = (\log x)^{x}$ and $v = x^{\log x}$
 $\therefore y = u + v$
 $\Rightarrow \frac{dy}{dx} = \frac{du}{dx} + \frac{dv}{dx}$...(1)
 $u = (\log x)^{x}$
 $\Rightarrow \log u = \log[(\log x)^{x}]$
 $\Rightarrow \log u = x \log(\log x)$

$$\frac{1}{u}\frac{du}{dx} = \frac{d}{dx}(x) \times \log(\log x) + x \cdot \frac{d}{dx} \left[\log(\log x) \right]$$

$$\Rightarrow \frac{du}{dx} = u \left[1 \times \log(\log x) + x \cdot \frac{1}{\log x} \cdot \frac{d}{dx} (\log x) \right]$$

$$\Rightarrow \frac{du}{dx} = (\log x)^{x} \left[\log(\log x) + \frac{x}{\log x} \cdot \frac{1}{x} \right]$$

$$\Rightarrow \frac{du}{dx} = (\log x)^{x} \left[\log(\log x) + \frac{1}{\log x} \right]$$

$$\Rightarrow \frac{du}{dx} = (\log x)^{x} \left[\frac{\log(\log x) \cdot \log x + 1}{\log x} \right]$$

$$\Rightarrow \frac{du}{dx} = (\log x)^{x-1} \left[1 + \log x \cdot \log(\log x) \right] \qquad \dots(2)$$

$$v = x^{\log x}$$

$$\Rightarrow \log v = \log \left(x^{\log x} \right)$$

Differentiating both sides with respect to x, we obtain

$$\frac{1}{v} \cdot \frac{dv}{dx} = \frac{d}{dx} \left[(\log x)^2 \right]$$

$$\Rightarrow \frac{1}{v} \cdot \frac{dv}{dx} = 2(\log x) \cdot \frac{d}{dx} (\log x)$$

$$\Rightarrow \frac{dv}{dx} = 2v (\log x) \cdot \frac{1}{x}$$

$$\Rightarrow \frac{dv}{dx} = 2x^{\log x} \frac{\log x}{x}$$

$$\Rightarrow \frac{dv}{dx} = 2x^{\log x-1} \cdot \log x \qquad \dots(3)$$

Therefore, from (1), (2), and (3), we obtain

$$\frac{dy}{dx} = \left(\log x\right)^{x-1} \left[1 + \log x \cdot \log\left(\log x\right)\right] + 2x^{\log x-1} \cdot \log x$$

Question 8:

Differentiate the function with respect to x.

$$(\sin x)^x + \sin^{-1}\sqrt{x}$$

Answer

Let
$$y = (\sin x)^x + \sin^{-1} \sqrt{x}$$

Also, let $u = (\sin x)^x$ and $v = \sin^{-1} \sqrt{x}$
 $\therefore y = u + v$
 $\Rightarrow \frac{dy}{dx} = \frac{du}{dx} + \frac{dv}{dx}$...(1)
 $u = (\sin x)^x$
 $\Rightarrow \log u = \log(\sin x)^x$
 $\Rightarrow \log u = x \log(\sin x)$

Differentiating both sides with respect to x, we obtain

$$\Rightarrow \frac{1}{u} \frac{du}{dx} = \frac{d}{dx} (x) \times \log(\sin x) + x \times \frac{d}{dx} [\log(\sin x)]$$

$$\Rightarrow \frac{du}{dx} = u \left[1 \cdot \log(\sin x) + x \cdot \frac{1}{\sin x} \cdot \frac{d}{dx} (\sin x) \right]$$

$$\Rightarrow \frac{du}{dx} = (\sin x)^{x} \left[\log(\sin x) + \frac{x}{\sin x} \cdot \cos x \right]$$

$$\Rightarrow \frac{du}{dx} = (\sin x)^{x} (x \cot x + \log \sin x) \qquad \dots (2)$$

$$v = \sin^{-1} \sqrt{x}$$

Differentiating both sides with respect to x, we obtain

$$\frac{dv}{dx} = \frac{1}{\sqrt{1 - (\sqrt{x})^2}} \cdot \frac{d}{dx} (\sqrt{x})$$
$$\Rightarrow \frac{dv}{dx} = \frac{1}{\sqrt{1 - x}} \cdot \frac{1}{2\sqrt{x}}$$
$$\Rightarrow \frac{dv}{dx} = \frac{1}{2\sqrt{x - x^2}} \qquad \dots(3)$$

Therefore, from (1), (2), and (3), we obtain

$$\frac{dy}{dx} = (\sin x)^x (x \cot x + \log \sin x) + \frac{1}{2\sqrt{x - x^2}}$$

Question 9:

Differentiate the function with respect to x.

 $x^{\sin x} + (\sin x)^{\cos x}$

Answer

Let
$$y = x^{\sin x} + (\sin x)^{\cos x}$$

Also, let $u = x^{\sin x}$ and $v = (\sin x)^{\cos x}$
 $\therefore y = u + v$
 $\Rightarrow \frac{dy}{dx} = \frac{du}{dx} + \frac{dv}{dx}$...(1)
 $u = x^{\sin x}$
 $\Rightarrow \log u = \log(x^{\sin x})$
 $\Rightarrow \log u = \sin x \log x$

Differentiating both sides with respect to x, we obtain

$$\frac{1}{u}\frac{du}{dx} = \frac{d}{dx}(\sin x) \cdot \log x + \sin x \cdot \frac{d}{dx}(\log x)$$

$$\Rightarrow \frac{du}{dx} = u \left[\cos x \log x + \sin x \cdot \frac{1}{x}\right]$$

$$\Rightarrow \frac{du}{dx} = x^{\sin x} \left[\cos x \log x + \frac{\sin x}{x}\right] \qquad \dots (2)$$

$$v = (\sin x)^{\cos x}$$

$$\Rightarrow \log v = \log(\sin x)^{\cos x}$$

$$\Rightarrow \log v = \cos x \log(\sin x)$$

$$\frac{1}{v}\frac{dv}{dx} = \frac{d}{dx}(\cos x) \times \log(\sin x) + \cos x \times \frac{d}{dx}\left[\log(\sin x)\right]$$

$$\Rightarrow \frac{dv}{dx} = v\left[-\sin x \cdot \log(\sin x) + \cos x \cdot \frac{1}{\sin x} \cdot \frac{d}{dx}(\sin x)\right]$$

$$\Rightarrow \frac{dv}{dx} = (\sin x)^{\cos x} \left[-\sin x \log \sin x + \frac{\cos x}{\sin x} \cos x\right]$$

$$\Rightarrow \frac{dv}{dx} = (\sin x)^{\cos x} \left[-\sin x \log \sin x + \cot x \cos x\right]$$

$$\Rightarrow \frac{dv}{dx} = (\sin x)^{\cos x} \left[\cot x \cos x - \sin x \log \sin x\right] \qquad \dots(3)$$

$$\frac{dy}{dx} = x^{\sin x} \left(\cos x \log x + \frac{\sin x}{x} \right) + \left(\sin x \right)^{\cos x} \left[\cos x \cot x - \sin x \log \sin x \right]$$

Question 10:

Differentiate the function with respect to x.

$$x^{x\cos x} + \frac{x^2 + 1}{x^2 - 1}$$

Answer

Let
$$y = x^{x\cos x} + \frac{x^2 + 1}{x^2 - 1}$$

Also, let $u = x^{x\cos x}$ and $v = \frac{x^2 + 1}{x^2 - 1}$
 $\therefore y = u + v$
 $\Rightarrow \frac{dy}{dx} = \frac{du}{dx} + \frac{dv}{dx}$...(1)
 $u = x^{x\cos x}$
 $\Rightarrow \log u = \log(x^{x\cos x})$
 $\Rightarrow \log u = x\cos x \log x$

$$\frac{1}{u}\frac{du}{dx} = \frac{d}{dx}(x) \cdot \cos x \cdot \log x + x \cdot \frac{d}{dx}(\cos x) \cdot \log x + x \cos x \cdot \frac{d}{dx}(\log x)$$

$$\Rightarrow \frac{du}{dx} = u \left[1 \cdot \cos x \cdot \log x + x \cdot (-\sin x) \log x + x \cos x \cdot \frac{1}{x} \right]$$

$$\Rightarrow \frac{du}{dx} = x^{x \cos x} \left(\cos x \log x - x \sin x \log x + \cos x \right)$$

$$\Rightarrow \frac{du}{dx} = x^{x \cos x} \left[\cos x (1 + \log x) - x \sin x \log x \right] \qquad \dots (2)$$

$$v = \frac{x^2 + 1}{x^2 - 1}$$

$$\Rightarrow \log v = \log(x^2 + 1) - \log(x^2 - 1)$$

Differentiating both sides with respect to x, we obtain

$$\frac{1}{v}\frac{dv}{dx} = \frac{2x}{x^2 + 1} - \frac{2x}{x^2 - 1}$$

$$\Rightarrow \frac{dv}{dx} = v \left[\frac{2x(x^2 - 1) - 2x(x^2 + 1)}{(x^2 + 1)(x^2 - 1)} \right]$$

$$\Rightarrow \frac{dv}{dx} = \frac{x^2 + 1}{x^2 - 1} \times \left[\frac{-4x}{(x^2 + 1)(x^2 - 1)} \right]$$

$$\Rightarrow \frac{dv}{dx} = \frac{-4x}{(x^2 - 1)^2} \qquad ...(3)$$

From (1), (2), and (3), we obtain

$$\frac{dy}{dx} = x^{x\cos x} \left[\cos x \left(1 + \log x \right) - x \sin x \log x \right] - \frac{4x}{\left(x^2 - 1 \right)^2}$$

Question 11:

Differentiate the function with respect to x.

 $(x\cos x)^x + (x\sin x)^{\frac{1}{x}}$

Answer

Let
$$y = (x \cos x)^{x} + (x \sin x)^{\frac{1}{x}}$$

Also, let $u = (x \cos x)^{x}$ and $v = (x \sin x)^{\frac{1}{x}}$
 $\therefore y = u + v$
 $\Rightarrow \frac{dy}{dx} = \frac{du}{dx} + \frac{dv}{dx}$...(1)
 $u = (x \cos x)^{x}$
 $\Rightarrow \log u = \log (x \cos x)^{x}$
 $\Rightarrow \log u = x \log (x \cos x)$
 $\Rightarrow \log u = x \log (x \cos x)$
 $\Rightarrow \log u = x \log (x + \log \cos x)$
 $\Rightarrow \log u = x \log x + x \log \cos x$

$$\frac{1}{u}\frac{du}{dx} = \frac{d}{dx}(x\log x) + \frac{d}{dx}(x\log \cos x)$$

$$\Rightarrow \frac{du}{dx} = u\left[\left\{\log x \cdot \frac{d}{dx}(x) + x \cdot \frac{d}{dx}(\log x)\right\} + \left\{\log \cos x \cdot \frac{d}{dx}(x) + x \cdot \frac{d}{dx}(\log \cos x)\right\}\right]$$

$$\Rightarrow \frac{du}{dx} = (x\cos x)^{x}\left[\left(\log x \cdot 1 + x \cdot \frac{1}{x}\right) + \left\{\log \cos x \cdot 1 + x \cdot \frac{1}{\cos x} \cdot \frac{d}{dx}(\cos x)\right\}\right]$$

$$\Rightarrow \frac{du}{dx} = (x\cos x)^{x}\left[\left(\log x + 1\right) + \left\{\log \cos x + \frac{x}{\cos x} \cdot (-\sin x)\right\}\right]$$

$$\Rightarrow \frac{du}{dx} = (x\cos x)^{x}\left[(1 + \log x) + (\log \cos x - x \tan x)\right]$$

$$\Rightarrow \frac{du}{dx} = (x\cos x)^{x}\left[1 - x\tan x + (\log x + \log \cos x)\right]$$
...(2)

$$v = (x \sin x)^{\frac{1}{x}}$$

$$\Rightarrow \log v = \log (x \sin x)^{\frac{1}{x}}$$

$$\Rightarrow \log v = \frac{1}{x} \log (x \sin x)$$

$$\Rightarrow \log v = \frac{1}{x} (\log x + \log \sin x)$$

$$\Rightarrow \log v = \frac{1}{x} \log x + \frac{1}{x} \log \sin x$$

Differentiating both sides with respect to x, we obtain

$$\frac{1}{v}\frac{dv}{dx} = \frac{d}{dx}\left(\frac{1}{x}\log x\right) + \frac{d}{dx}\left[\frac{1}{x}\log(\sin x)\right]$$

$$\Rightarrow \frac{1}{v}\frac{dv}{dx} = \left[\log x \cdot \frac{d}{dx}\left(\frac{1}{x}\right) + \frac{1}{x} \cdot \frac{d}{dx}\left(\log x\right)\right] + \left[\log(\sin x) \cdot \frac{d}{dx}\left(\frac{1}{x}\right) + \frac{1}{x} \cdot \frac{d}{dx}\left\{\log(\sin x)\right\}\right]$$

$$\Rightarrow \frac{1}{v}\frac{dv}{dx} = \left[\log x \cdot \left(-\frac{1}{x^2}\right) + \frac{1}{x} \cdot \frac{1}{x}\right] + \left[\log(\sin x) \cdot \left(-\frac{1}{x^2}\right) + \frac{1}{x} \cdot \frac{1}{\sin x} \cdot \frac{d}{dx}(\sin x)\right]$$

$$\Rightarrow \frac{1}{v}\frac{dv}{dx} = \frac{1}{x^2}(1 - \log x) + \left[-\frac{\log(\sin x)}{x^2} + \frac{1}{x\sin x} \cdot \cos x\right]$$

$$\Rightarrow \frac{dv}{dx} = (x\sin x)^{\frac{1}{x}}\left[\frac{1 - \log x}{x^2} + \frac{-\log(\sin x) + x\cot x}{x^2}\right]$$

$$\Rightarrow \frac{dv}{dx} = (x\sin x)^{\frac{1}{x}}\left[\frac{1 - \log(x - \log(\sin x) + x\cot x}{x^2}\right]$$

$$\Rightarrow \frac{dv}{dx} = (x\sin x)^{\frac{1}{x}}\left[\frac{1 - \log(x\sin x) + x\cot x}{x^2}\right]$$
...(3)

From (1), (2), and (3), we obtain

$$\frac{dy}{dx} = (x\cos x)^x \left[1 - x\tan x + \log(x\cos x)\right] + (x\sin x)^{\frac{1}{x}} \left[\frac{x\cot x + 1 - \log(x\sin x)}{x^2}\right]$$

Question 12:

Find
$$\frac{dy}{dx}$$
 of function.

$$x^{y} + y^{x} = 1$$

Answer

The given function is $x^{y} + y^{x} = 1$ Let $x^{y} = u$ and $y^{x} = v$ Then, the function becomes u + v = 1

$$\therefore \frac{du}{dx} + \frac{dv}{dx} = 0 \qquad \dots(1)$$
$$u = x^{y}$$
$$\Rightarrow \log u = \log(x^{y})$$
$$\Rightarrow \log u = y \log x$$

Differentiating both sides with respect to x, we obtain

$$\frac{1}{u}\frac{du}{dx} = \log x \frac{dy}{dx} + y \cdot \frac{d}{dx}(\log x)$$

$$\Rightarrow \frac{du}{dx} = u \left[\log x \frac{dy}{dx} + y \cdot \frac{1}{x} \right]$$

$$\Rightarrow \frac{du}{dx} = x^{y} \left(\log x \frac{dy}{dx} + \frac{y}{x} \right) \qquad \dots(2)$$

$$v = y^{x}$$

$$\Rightarrow \log v = \log \left(y^{x} \right)$$

$$\Rightarrow \log v = x \log y$$

Differentiating both sides with respect to x, we obtain

$$\frac{1}{v} \cdot \frac{dv}{dx} = \log y \cdot \frac{d}{dx} (x) + x \cdot \frac{d}{dx} (\log y)$$
$$\Rightarrow \frac{dv}{dx} = v \left(\log y \cdot 1 + x \cdot \frac{1}{y} \cdot \frac{dy}{dx} \right)$$
$$\Rightarrow \frac{dv}{dx} = y^{x} \left(\log y + \frac{x}{y} \frac{dy}{dx} \right) \qquad \dots(3)$$

From (1), (2), and (3), we obtain

$$x^{y} \left(\log x \frac{dy}{dx} + \frac{y}{x} \right) + y^{x} \left(\log y + \frac{x}{y} \frac{dy}{dx} \right) = 0$$
$$\Rightarrow \left(x^{y} \log x + xy^{x-1} \right) \frac{dy}{dx} = -\left(yx^{y-1} + y^{x} \log y \right)$$
$$\therefore \frac{dy}{dx} = -\frac{yx^{y-1} + y^{x} \log y}{x^{y} \log x + xy^{x-1}}$$

Question 13:

Find
$$\frac{dy}{dx}$$
 of function.

$$y^x = x^y$$

Answer

The given function is $y^x = x^y$

Taking logarithm on both the sides, we obtain

$$x \log y = y \log x$$

Differentiating both sides with respect to x, we obtain

$$\log y \cdot \frac{d}{dx}(x) + x \cdot \frac{d}{dx}(\log y) = \log x \cdot \frac{d}{dx}(y) + y \cdot \frac{d}{dx}(\log x)$$

$$\Rightarrow \log y \cdot 1 + x \cdot \frac{1}{y} \cdot \frac{dy}{dx} = \log x \cdot \frac{dy}{dx} + y \cdot \frac{1}{x}$$

$$\Rightarrow \log y + \frac{x}{y} \frac{dy}{dx} = \log x \frac{dy}{dx} + \frac{y}{x}$$

$$\Rightarrow \left(\frac{x}{y} - \log x\right) \frac{dy}{dx} = \frac{y}{x} - \log y$$

$$\Rightarrow \left(\frac{x - y \log x}{y}\right) \frac{dy}{dx} = \frac{y - x \log y}{x}$$

$$\therefore \frac{dy}{dx} = \frac{y}{x} \left(\frac{y - x \log y}{x - y \log x}\right)$$

Question 14:

Find
$$\frac{dy}{dx}$$
 of function.

$$(\cos x)^y = (\cos y)^x$$

Answer

The given function is $(\cos x)^y = (\cos y)^x$ Taking logarithm on both the sides, we obtain $y \log \cos x = x \log \cos y$

Differentiating both sides, we obtain

$$\log \cos x \cdot \frac{dy}{dx} + y \cdot \frac{d}{dx} (\log \cos x) = \log \cos y \cdot \frac{d}{dx} (x) + x \cdot \frac{d}{dx} (\log \cos y)$$

$$\Rightarrow \log \cos x \frac{dy}{dx} + y \cdot \frac{1}{\cos x} \cdot \frac{d}{dx} (\cos x) = \log \cos y \cdot 1 + x \cdot \frac{1}{\cos y} \cdot \frac{d}{dx} (\cos y)$$

$$\Rightarrow \log \cos x \frac{dy}{dx} + \frac{y}{\cos x} \cdot (-\sin x) = \log \cos y + \frac{x}{\cos y} (-\sin y) \cdot \frac{dy}{dx}$$

$$\Rightarrow \log \cos x \frac{dy}{dx} - y \tan x = \log \cos y - x \tan y \frac{dy}{dx}$$

$$\Rightarrow (\log \cos x + x \tan y) \frac{dy}{dx} = y \tan x + \log \cos y$$

$$\therefore \frac{dy}{dx} = \frac{y \tan x + \log \cos y}{x \tan y + \log \cos x}$$

Question 15:

Find dx of function.

 $xy = e^{(x-y)}$

Answer

The given function is $xy = e^{(x-y)}$

Taking logarithm on both the sides, we obtain

$$\log (xy) = \log (e^{x-y})$$

$$\Rightarrow \log x + \log y = (x-y)\log e$$

$$\Rightarrow \log x + \log y = (x-y) \times 1$$

$$\Rightarrow \log x + \log y = x-y$$

Differentiating both sides with respect to x, we obtain

$$\frac{d}{dx}(\log x) + \frac{d}{dx}(\log y) = \frac{d}{dx}(x) - \frac{dy}{dx}$$
$$\Rightarrow \frac{1}{x} + \frac{1}{y}\frac{dy}{dx} = 1 - \frac{dy}{dx}$$
$$\Rightarrow \left(1 + \frac{1}{y}\right)\frac{dy}{dx} = 1 - \frac{1}{x}$$
$$\Rightarrow \left(\frac{y+1}{y}\right)\frac{dy}{dx} = \frac{x-1}{x}$$
$$\therefore \frac{dy}{dx} = \frac{y(x-1)}{x(y+1)}$$

Question 16:

Find the derivative of the function given by $f(x) = (1+x)(1+x^2)(1+x^4)(1+x^8)$ and hence

find f'(1).

Answer

The given relationship is
$$f(x) = (1+x)(1+x^2)(1+x^4)(1+x^8)$$

Taking logarithm on both the sides, we obtain

 $\log f(x) = \log(1+x) + \log(1+x^{2}) + \log(1+x^{4}) + \log(1+x^{8})$

$$\frac{1}{f(x)} \cdot \frac{d}{dx} \Big[f(x) \Big] = \frac{d}{dx} \log(1+x) + \frac{d}{dx} \log(1+x^2) + \frac{d}{dx} \log(1+x^4) + \frac{d}{dx} \log(1+x^8)$$

$$\Rightarrow \frac{1}{f(x)} \cdot f'(x) = \frac{1}{1+x} \cdot \frac{d}{dx} (1+x) + \frac{1}{1+x^2} \cdot \frac{d}{dx} (1+x^2) + \frac{1}{1+x^4} \cdot \frac{d}{dx} (1+x^4) + \frac{1}{1+x^8} \cdot \frac{d}{dx} (1+x^8)$$

$$\Rightarrow f'(x) = f(x) \Big[\frac{1}{1+x} + \frac{1}{1+x^2} \cdot 2x + \frac{1}{1+x^4} \cdot 4x^3 + \frac{1}{1+x^8} \cdot 8x^7 \Big]$$

$$\therefore f'(x) = (1+x)(1+x^2)(1+x^4)(1+x^8) \Big[\frac{1}{1+x} + \frac{2x}{1+x^2} + \frac{4x^3}{1+x^4} + \frac{8x^7}{1+x^8} \Big]$$

Hence, $f'(1) = (1+1)(1+1^2)(1+1^4)(1+1^8) \Big[\frac{1}{1+1} + \frac{2\times 1}{1+1^2} + \frac{4\times 1^3}{1+1^4} + \frac{8\times 1^7}{1+1^8} \Big]$

$$= 2 \times 2 \times 2 \times 2 \Big[\frac{1}{2} + \frac{2}{2} + \frac{4}{2} + \frac{8}{2} \Big]$$

$$= 16 \times \Big[\frac{1+2+4+8}{2} \Big]$$

Question 17:

Differentiate $(x^5 - 5x + 8)(x^3 + 7x + 9)$ in three ways mentioned below (i) By using product rule.

(ii) By expanding the product to obtain a single polynomial.

(iii By logarithmic differentiation.

Do they all give the same answer?

Answer

Let
$$y = (x^5 - 5x + 8)(x^3 + 7x + 9)$$

(i)

Let
$$x^2 - 5x + 8 = u$$
 and $x^3 + 7x + 9 = v$

⇒ $\frac{dy}{dx} = \frac{du}{dx} \cdot v + u \cdot \frac{dv}{dx}$ (By using product rule)

⇒ $\frac{dy}{dx} = \frac{d}{dx} (x^2 - 5x + 8) \cdot (x^3 + 7x + 9) + (x^2 - 5x + 8) \cdot \frac{d}{dx} (x^3 + 7x + 9)$

⇒ $\frac{dy}{dx} = (2x - 5) (x^3 + 7x + 9) + (x^2 - 5x + 8) (3x^2 + 7)$

⇒ $\frac{dy}{dx} = 2x (x^3 + 7x + 9) - 5 (x^3 + 7x + 9) + x^2 (3x^2 + 7) - 5x (3x^2 + 7) + 8 (3x^2 + 7)$

⇒ $\frac{dy}{dx} = (2x^4 + 14x^2 + 18x) - 5x^3 - 35x - 45 + (3x^4 + 7x^2) - 15x^3 - 35x + 24x^2 + 56$

∴ $\frac{dy}{dx} = 5x^4 - 20x^3 + 45x^2 - 52x + 11$
(ii)

$$y = (x^{2} - 5x + 8)(x^{3} + 7x + 9)$$

$$= x^{2}(x^{3} + 7x + 9) - 5x(x^{3} + 7x + 9) + 8(x^{3} + 7x + 9)$$

$$= x^{5} + 7x^{3} + 9x^{2} - 5x^{4} - 35x^{2} - 45x + 8x^{3} + 56x + 72$$

$$= x^{5} - 5x^{4} + 15x^{3} - 26x^{2} + 11x + 72$$

$$\therefore \frac{dy}{dx} = \frac{d}{dx}(x^{5} - 5x^{4} + 15x^{3} - 26x^{2} + 11x + 72)$$

$$= \frac{d}{dx}(x^{5}) - 5\frac{d}{dx}(x^{4}) + 15\frac{d}{dx}(x^{3}) - 26\frac{d}{dx}(x^{2}) + 11\frac{d}{dx}(x) + \frac{d}{dx}(72)$$

$$= 5x^{4} - 5 \times 4x^{3} + 15 \times 3x^{2} - 26 \times 2x + 11 \times 1 + 0$$

$$= 5x^{4} - 20x^{3} + 45x^{2} - 52x + 11$$

(iii) $y = (x^{2} - 5x + 8)(x^{3} + 7x + 9)$

Taking logarithm on both the sides, we obtain

 $\log y = \log \left(x^2 - 5x + 8 \right) + \log \left(x^3 + 7x + 9 \right)$

$$\frac{1}{y}\frac{dy}{dx} = \frac{d}{dx}\log(x^2 - 5x + 8) + \frac{d}{dx}\log(x^3 + 7x + 9)$$

$$\Rightarrow \frac{1}{y}\frac{dy}{dx} = \frac{1}{x^2 - 5x + 8} \cdot \frac{d}{dx}(x^2 - 5x + 8) + \frac{1}{x^3 + 7x + 9} \cdot \frac{d}{dx}(x^3 + 7x + 9)$$

$$\Rightarrow \frac{dy}{dx} = y\left[\frac{1}{x^2 - 5x + 8} \times (2x - 5) + \frac{1}{x^3 + 7x + 9} \times (3x^2 + 7)\right]$$

$$\Rightarrow \frac{dy}{dx} = (x^2 - 5x + 8)(x^3 + 7x + 9)\left[\frac{2x - 5}{x^2 - 5x + 8} + \frac{3x^2 + 7}{x^3 + 7x + 9}\right]$$

$$\Rightarrow \frac{dy}{dx} = (x^2 - 5x + 8)(x^3 + 7x + 9)\left[\frac{(2x - 5)(x^3 + 7x + 9) + (3x^2 + 7)(x^2 - 5x + 8)}{(x^2 - 5x + 8)(x^3 + 7x + 9)}\right]$$

$$\Rightarrow \frac{dy}{dx} = 2x(x^3 + 7x + 9) - 5(x^3 + 7x + 9) + 3x^2(x^2 - 5x + 8) + 7(x^2 - 5x + 8)$$

$$\Rightarrow \frac{dy}{dx} = (2x^4 + 14x^2 + 18x) - 5x^3 - 35x - 45 + (3x^4 - 15x^3 + 24x^2) + (7x^2 - 35x + 56)$$

$$\Rightarrow \frac{dy}{dx} = 5x^4 - 20x^3 + 45x^2 - 52x + 11$$

From the above three observations, it can be concluded that all the results of dx are same.

Question 18:

If u, v and w are functions of x, then show that

$$\frac{d}{dx}(u.v.w) = \frac{du}{dx}v.w + u.\frac{dv}{dx}.w + u.v.\frac{dw}{dx}$$

in two ways-first by repeated application of product rule, second by logarithmic differentiation.

Answer

Let y = u.v.w = u.(v.w)

By applying product rule, we obtain

$$\frac{dy}{dx} = \frac{du}{dx} \cdot (v \cdot w) + u \cdot \frac{d}{dx} (v \cdot w)$$

$$\Rightarrow \frac{dy}{dx} = \frac{du}{dx} \cdot v \cdot w + u \left[\frac{dv}{dx} \cdot w + v \cdot \frac{dw}{dx} \right] \qquad (Again applying product rule)$$

$$\Rightarrow \frac{dy}{dx} = \frac{du}{dx} \cdot v \cdot w + u \cdot \frac{dv}{dx} \cdot w + u \cdot v \cdot \frac{dw}{dx}$$

By taking logarithm on both sides of the equation y = u.v.w, we obtain $\log y = \log u + \log v + \log w$

$$\frac{1}{y} \cdot \frac{dy}{dx} = \frac{d}{dx} (\log u) + \frac{d}{dx} (\log v) + \frac{d}{dx} (\log w)$$
$$\Rightarrow \frac{1}{y} \cdot \frac{dy}{dx} = \frac{1}{u} \frac{du}{dx} + \frac{1}{v} \frac{dv}{dx} + \frac{1}{w} \frac{dw}{dx}$$
$$\Rightarrow \frac{dy}{dx} = y \left(\frac{1}{u} \frac{du}{dx} + \frac{1}{v} \frac{dv}{dx} + \frac{1}{w} \frac{dw}{dx} \right)$$
$$\Rightarrow \frac{dy}{dx} = u.v.w. \left(\frac{1}{u} \frac{du}{dx} + \frac{1}{v} \frac{dv}{dx} + \frac{1}{w} \frac{dw}{dx} \right)$$
$$\therefore \frac{dy}{dx} = \frac{du}{dx} \cdot v \cdot w + u \cdot \frac{dv}{dx} \cdot w + u \cdot v \cdot \frac{dw}{dx}$$

Exercise 5.6

Question 1:

If x and y are connected parametrically by the equation, without eliminating the

parameter, find
$$\frac{dy}{dx}$$
.

$$x = 2at^2$$
, $y = at^4$

Answer

The given equations are $x = 2at^2$ and $y = at^4$

Then,
$$\frac{dx}{dt} = \frac{d}{dt} (2at^2) = 2a \cdot \frac{d}{dt} (t^2) = 2a \cdot 2t = 4at$$

 $\frac{dy}{dt} = \frac{d}{dt} (at^4) = a \cdot \frac{d}{dt} (t^4) = a \cdot 4 \cdot t^3 = 4at^3$
 $\therefore \frac{dy}{dx} = \frac{\left(\frac{dy}{dt}\right)}{\left(\frac{dx}{dt}\right)} = \frac{4at^3}{4at} = t^2$

Question 2:

If x and y are connected parametrically by the equation, without eliminating the

parameter, find \overline{dx} .

 $x = a \cos \theta, y = b \cos \theta$

dy

Answer

The given equations are $x = a \cos \theta$ and $y = b \cos \theta$

Then,
$$\frac{dx}{d\theta} = \frac{d}{d\theta} (a\cos\theta) = a(-\sin\theta) = -a\sin\theta$$

 $\frac{dy}{d\theta} = \frac{d}{d\theta} (b\cos\theta) = b(-\sin\theta) = -b\sin\theta$
 $\therefore \frac{dy}{dx} = \frac{\left(\frac{dy}{d\theta}\right)}{\left(\frac{dx}{d\theta}\right)} = \frac{-b\sin\theta}{-a\sin\theta} = \frac{b}{a}$

Question 3:

If x and y are connected parametrically by the equation, without eliminating the

parameter, find
$$\frac{dy}{dx}$$
.
 $x = \sin t$, $y = \cos 2t$
Answer
The given equations are $x = \sin t$ and $y = \cos 2t$
Then, $\frac{dx}{dt} = \frac{d}{dt}(\sin t) = \cos t$
 $\frac{dy}{dt} = \frac{d}{dt}(\sin t) = \cos t$

$$\frac{dy}{dt} = \frac{d}{dt} (\cos 2t) = -\sin 2t \cdot \frac{d}{dt} (2t) = -2\sin 2t$$
$$\therefore \frac{dy}{dx} = \frac{\left(\frac{dy}{dt}\right)}{\left(\frac{dx}{dt}\right)} = \frac{-2\sin 2t}{\cos t} = \frac{-2\cdot 2\sin t\cos t}{\cos t} = -4\sin t$$

Question 4:

If x and y are connected parametrically by the equation, without eliminating the

$$\frac{dy}{dy}$$

parameter, find dx.

$$x = 4t, y = \frac{4}{t}$$

Answer

$$x = 4t$$
 and $y = \frac{4}{t}$
The given equations are

$$\frac{dx}{dt} = \frac{d}{dt}(4t) = 4$$

$$\frac{dy}{dt} = \frac{d}{dt}\left(\frac{4}{t}\right) = 4 \cdot \frac{d}{dt}\left(\frac{1}{t}\right) = 4 \cdot \left(\frac{-1}{t^2}\right) = \frac{-4}{t^2}$$

$$\therefore \frac{dy}{dx} = \frac{\left(\frac{dy}{dt}\right)}{\left(\frac{dx}{dt}\right)} = \frac{\left(\frac{-4}{t^2}\right)}{4} = \frac{-1}{t^2}$$

Question 5:

If x and y are connected parametrically by the equation, without eliminating the

parameter, find $\frac{dy}{dx}$.

parameter, find 🏎 .

$$x = \cos\theta - \cos 2\theta, \ y = \sin\theta - \sin 2\theta$$

Answer

The given equations are $x = \cos \theta - \cos 2\theta$ and $y = \sin \theta - \sin 2\theta$

Then,
$$\frac{dx}{d\theta} = \frac{d}{d\theta} (\cos \theta - \cos 2\theta) = \frac{d}{d\theta} (\cos \theta) - \frac{d}{d\theta} (\cos 2\theta)$$

 $= -\sin \theta - (-2\sin 2\theta) = 2\sin 2\theta - \sin \theta$
 $\frac{dy}{d\theta} = \frac{d}{d\theta} (\sin \theta - \sin 2\theta) = \frac{d}{d\theta} (\sin \theta) - \frac{d}{d\theta} (\sin 2\theta)$
 $= \cos \theta - 2\cos 2\theta$
 $\therefore \frac{dy}{dx} = \frac{\left(\frac{dy}{d\theta}\right)}{\left(\frac{dx}{d\theta}\right)} = \frac{\cos \theta - 2\cos 2\theta}{2\sin 2\theta - \sin \theta}$

Question 6:

If x and y are connected parametrically by the equation, without eliminating the

parameter, find
$$\frac{dy}{dx}$$
.
 $x = a(\theta - \sin \theta), \ y = a(1 + \cos \theta)$

Answer

The given equations are $x = a(\theta - \sin\theta)$ and $y = a(1 + \cos\theta)$ Then, $\frac{dx}{d\theta} = a\left[\frac{d}{d\theta}(\theta) - \frac{d}{d\theta}(\sin\theta)\right] = a(1 - \cos\theta)$ $\frac{dy}{d\theta} = a\left[\frac{d}{d\theta}(1) + \frac{d}{d\theta}(\cos\theta)\right] = a\left[0 + (-\sin\theta)\right] = -a\sin\theta$ $\therefore \frac{dy}{dx} = \frac{\left(\frac{dy}{d\theta}\right)}{\left(\frac{dx}{d\theta}\right)} = \frac{-a\sin\theta}{a(1 - \cos\theta)} = \frac{-2\sin\frac{\theta}{2}\cos\frac{\theta}{2}}{2\sin^2\frac{\theta}{2}} = \frac{-\cos\frac{\theta}{2}}{\sin\frac{\theta}{2}} = -\cot\frac{\theta}{2}$

Question 7:

If x and y are connected parametrically by the equation, without eliminating the

parameter, find
$$\frac{dy}{dx}$$
.

$$x = \frac{\sin^3 t}{\sqrt{\cos 2t}}, \ y = \frac{\cos^3 t}{\sqrt{\cos 2t}}$$

Answer

The given equations are
$$x = \frac{\sin^3 t}{\sqrt{\cos 2t}}$$
 and $y = \frac{\cos^3 t}{\sqrt{\cos 2t}}$

Then,
$$\frac{dx}{dt} = \frac{d}{dt} \left[\frac{\sin^3 t}{\sqrt{\cos 2t}} \right]$$
$$= \frac{\sqrt{\cos 2t} \cdot \frac{d}{dt} (\sin^3 t) - \sin^3 t \cdot \frac{d}{dt} \sqrt{\cos 2t}}{\cos 2t}$$
$$= \frac{\sqrt{\cos 2t} \cdot 3\sin^2 t \cdot \frac{d}{dt} (\sin t) - \sin^3 t \times \frac{1}{2\sqrt{\cos 2t}} \cdot \frac{d}{dt} (\cos 2t)}{\cos 2t}$$
$$= \frac{3\sqrt{\cos 2t} \cdot \sin^2 t \cos t - \frac{\sin^3 t}{2\sqrt{\cos 2t}} \cdot (-2\sin 2t)}{\cos 2t}$$
$$= \frac{3\cos 2t \sin^2 t \cos t + \sin^3 t \sin 2t}{\cos 2t \sqrt{\cos 2t}}$$
$$\frac{dy}{dt} = \frac{d}{dt} \left[\frac{\cos^3 t}{\sqrt{\cos 2t}} \right]$$
$$= \frac{\sqrt{\cos 2t} \cdot \frac{d}{dt} (\cos^3 t) - \cos^3 t \cdot \frac{d}{dt} (\sqrt{\cos 2t})}{\cos 2t}$$
$$= \frac{\sqrt{\cos 2t} \cdot \frac{d}{dt} (\cos t) - \cos^3 t \cdot \frac{1}{2\sqrt{\cos 2t}} \cdot \frac{d}{dt} (\cos 2t)}{\cos 2t}$$
$$= \frac{3\sqrt{\cos 2t} \cdot \cos^2 t (-\sin t) - \cos^3 t \cdot \frac{1}{2\sqrt{\cos 2t}} \cdot (-2\sin 2t)}{\cos 2t}$$
$$= \frac{3\sqrt{\cos 2t} \cdot \cos^2 t (-\sin t) - \cos^3 t \cdot \frac{1}{2\sqrt{\cos 2t}} \cdot (-2\sin 2t)}{\cos 2t}$$
$$= \frac{-3\cos 2t \cdot \cos^2 t (-\sin t) + \cos^3 t \sin 2t}{\cos 2t}$$

$$\therefore \frac{dy}{dx} = \frac{\left(\frac{dy}{dt}\right)}{\left(\frac{dx}{dt}\right)} = \frac{-3\cos 2t \cdot \cos^2 t \cdot \sin t + \cos^3 t \sin 2t}{3\cos 2t \sin^2 t \cos t + \sin^3 t \sin 2t}$$

$$= \frac{-3\cos 2t \cdot \cos^2 t \cdot \sin t + \cos^3 t (2\sin t \cos t)}{3\cos 2t \sin^2 t \cos t + \sin^3 t (2\sin t \cos t)}$$

$$= \frac{\sin t \cos t \left[-3\cos 2t \cdot \cos t + 2\cos^3 t\right]}{\sin t \cos t \left[3\cos 2t \sin t + 2\sin^3 t\right]}$$

$$= \frac{\left[-3\left(2\cos^2 t - 1\right)\cos t + 2\cos^3 t\right]}{\left[3\left(1 - 2\sin^2 t\right)\sin t + 2\sin^3 t\right]}$$

$$= \frac{-4\cos^3 t + 3\cos t}{3\sin t - 4\sin^3 t}$$

$$= -\cos 3t$$

$$\begin{bmatrix}\cos 3t = 4\cos^3 t - 3\cos t, \\\sin 3t = 3\sin t - 4\sin^3 t\end{bmatrix}$$

Question 8:

If x and y are connected parametrically by the equation, without eliminating the

parameter, find
$$\frac{dy}{dx}$$
.
 $x = a \left(\cos t + \log \tan \frac{t}{2} \right), \ y = a \sin t$

Answer

$$x = a \left(\cos t + \log \tan \frac{t}{2} \right) \text{ and } y = a \sin t$$
are

The given equations are

Then,
$$\frac{dx}{dt} = a \cdot \left[\frac{d}{dt} (\cos t) + \frac{d}{dt} \left(\log \tan \frac{t}{2} \right) \right]$$

$$= a \left[-\sin t + \frac{1}{\tan \frac{t}{2}} \cdot \frac{d}{dt} \left(\tan \frac{t}{2} \right) \right]$$

$$= a \left[-\sin t + \cot \frac{t}{2} \cdot \sec^2 \frac{t}{2} \cdot \frac{d}{dt} \left(\frac{t}{2} \right) \right]$$

$$= a \left[-\sin t + \cot \frac{t}{2} \cdot \sec^2 \frac{t}{2} \cdot \frac{1}{2} \right]$$

$$= a \left[-\sin t + \frac{\cos \frac{t}{2}}{\sin \frac{t}{2}} \times \frac{1}{\cos^2 \frac{t}{2}} \right]$$

$$= a \left[-\sin t + \frac{1}{2\sin \frac{t}{2}\cos \frac{t}{2}} \right]$$

$$= a \left(-\sin t + \frac{1}{\sin t} \right)$$

$$= a \left(-\sin t + \frac{1}{\sin t} \right)$$

$$= a \left(\frac{-\sin^2 t + 1}{\sin t} \right)$$

$$= a \frac{\cos^2 t}{\sin t}$$

$$\frac{dy}{dt} = a \frac{d}{dt} (\sin t) = a \cos t$$

$$\therefore \frac{dy}{dx} = \frac{\left(\frac{dy}{dt} \right)}{\left(\frac{dx}{dt} \right)} = \frac{a \cos t}{\left(a \frac{\cos^2 t}{\sin t} \right)} = \frac{\sin t}{\cos t} = \tan t$$

Question 9:

If x and y are connected parametrically by the equation, without eliminating the

parameter, find
$$\frac{dy}{dx}$$
.
 $x = a \sec \theta, \ y = b \tan \theta$

Answer

The given equations are $x = a \sec \theta$ and $y = b \tan \theta$

Then,
$$\frac{dx}{d\theta} = a \cdot \frac{d}{d\theta} (\sec \theta) = a \sec \theta \tan \theta$$

 $\frac{dy}{d\theta} = b \cdot \frac{d}{d\theta} (\tan \theta) = b \sec^2 \theta$
 $\therefore \frac{dy}{dx} = \frac{\left(\frac{dy}{d\theta}\right)}{\left(\frac{dx}{d\theta}\right)} = \frac{b \sec^2 \theta}{a \sec \theta \tan \theta} = \frac{b}{a} \sec \theta \cot \theta = \frac{b \cos \theta}{a \cos \theta \sin \theta} = \frac{b}{a} \times \frac{1}{\sin \theta} = \frac{b}{a} \csc \theta$

Question 10:

If x and y are connected parametrically by the equation, without eliminating the

parameter, find
$$\frac{dy}{dx}$$
.
 $x = a(\cos\theta + \theta\sin\theta), y = a(\sin\theta - \theta\cos\theta)$

Answer

The given equations are $x = a(\cos\theta + \theta\sin\theta)$ and $y = a(\sin\theta - \theta\cos\theta)$

Then,
$$\frac{dx}{d\theta} = a \left[\frac{d}{d\theta} \cos \theta + \frac{d}{d\theta} (\theta \sin \theta) \right] = a \left[-\sin \theta + \theta \frac{d}{d\theta} (\sin \theta) + \sin \theta \frac{d}{d\theta} (\theta) \right]$$

$$= a \left[-\sin \theta + \theta \cos \theta + \sin \theta \right] = a \theta \cos \theta$$

$$\frac{dy}{d\theta} = a \left[\frac{d}{d\theta} (\sin \theta) - \frac{d}{d\theta} (\theta \cos \theta) \right] = a \left[\cos \theta - \left\{ \theta \frac{d}{d\theta} (\cos \theta) + \cos \theta \cdot \frac{d}{d\theta} (\theta) \right\} \right]$$

$$= a \left[\cos \theta + \theta \sin \theta - \cos \theta \right]$$

$$= a \theta \sin \theta$$

$$(dy)$$

$$\therefore \frac{dy}{dx} = \frac{\left(\frac{dy}{d\theta}\right)}{\left(\frac{dx}{d\theta}\right)} = \frac{a\theta\sin\theta}{a\theta\cos\theta} = \tan\theta$$

Mobile: 9999 249717

Question 11:

$$x = \sqrt{a^{\sin^{-1}t}}, y = \sqrt{a^{\cos^{-1}t}}, \text{ show that } \frac{dy}{dx} = -\frac{y}{x}$$

Answer

The given equations are $x = \sqrt{a^{\sin^{-1}t}}$ and $y = \sqrt{a^{\cos^{-1}t}}$

$$x = \sqrt{a^{\sin^{-1}t}} \text{ and } y = \sqrt{a^{\cos^{-1}t}}$$
$$\Rightarrow x = \left(a^{\sin^{-1}t}\right)^{\frac{1}{2}} \text{ and } y = \left(a^{\cos^{-1}t}\right)^{\frac{1}{2}}$$
$$\Rightarrow x = a^{\frac{1}{2}\sin^{-1}t} \text{ and } y = a^{\frac{1}{2}\cos^{-1}t}$$

Consider $x = a^{2^{-1}}$

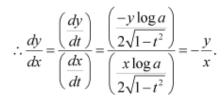

Taking logarithm on both the sides, we obtain

$$\log x = \frac{1}{2} \sin^{-1} t \log a$$
$$\therefore \frac{1}{x} \cdot \frac{dx}{dt} = \frac{1}{2} \log a \cdot \frac{d}{dt} (\sin^{-1} t)$$
$$\Rightarrow \frac{dx}{dt} = \frac{x}{2} \log a \cdot \frac{1}{\sqrt{1 - t^2}}$$
$$\Rightarrow \frac{dx}{dt} = \frac{x \log a}{2\sqrt{1 - t^2}}$$

Then, consider $y = a^{\frac{1}{2}\cos^{-1}t}$

Taking logarithm on both the sides, we obtain

$$\log y = \frac{1}{2} \cos^{-1} t \log a$$
$$\therefore \frac{1}{y} \cdot \frac{dy}{dx} = \frac{1}{2} \log a \cdot \frac{d}{dt} (\cos^{-1} t)$$
$$\Rightarrow \frac{dy}{dt} = \frac{y \log a}{2} \cdot \left(\frac{-1}{\sqrt{1 - t^2}}\right)$$
$$\Rightarrow \frac{dy}{dt} = \frac{-y \log a}{2\sqrt{1 - t^2}}$$

Hence, proved.

Exercise 5.7

Question 1:

Find the second order derivatives of the function.

 $x^{2} + 3x + 2$

Answer

Let
$$y = x^2 + 3x + 2$$

Then,

$$\frac{dy}{dx} = \frac{d}{dx} \left(x^2 \right) + \frac{d}{dx} \left(3x \right) + \frac{d}{dx} \left(2 \right) = 2x + 3 + 0 = 2x + 3$$
$$\therefore \frac{d^2 y}{dx^2} = \frac{d}{dx} \left(2x + 3 \right) = \frac{d}{dx} \left(2x \right) + \frac{d}{dx} \left(3 \right) = 2 + 0 = 2$$

Question 2:

Find the second order derivatives of the function.

 x^{20}

Answer

Let
$$y = x^{20}$$

Then,

$$\frac{dy}{dx} = \frac{d}{dx} \left(x^{20} \right) = 20x^{19}$$

$$\therefore \frac{d^2 y}{dx^2} = \frac{d}{dx} \left(20x^{19} \right) = 20 \frac{d}{dx} \left(x^{19} \right) = 20 \cdot 19 \cdot x^{18} = 380x^{18}$$

Question 3:

Find the second order derivatives of the function.

 $x \cdot \cos x$ Answer Let $y = x \cdot \cos x$

Then,

$$\frac{dy}{dx} = \frac{d}{dx}(x \cdot \cos x) = \cos x \cdot \frac{d}{dx}(x) + x \frac{d}{dx}(\cos x) = \cos x \cdot 1 + x(-\sin x) = \cos x - x \sin x$$
$$\therefore \frac{d^2 y}{dx^2} = \frac{d}{dx}[\cos x - x \sin x] = \frac{d}{dx}(\cos x) - \frac{d}{dx}(x \sin x)$$
$$= -\sin x - \left[\sin x \cdot \frac{d}{dx}(x) + x \cdot \frac{d}{dx}(\sin x)\right]$$
$$= -\sin x - \left[\sin x + x \cos x\right)$$
$$= -(x \cos x + 2 \sin x)$$

Question 4:

Find the second order derivatives of the function.

 $\log x$

Answer

Let $y = \log x$

Then,

$$\frac{dy}{dx} = \frac{d}{dx} (\log x) = \frac{1}{x}$$
$$\therefore \frac{d^2 y}{dx^2} = \frac{d}{dx} (\frac{1}{x}) = \frac{-1}{x^2}$$

Question 5:

Find the second order derivatives of the function.

 $x^3 \log x$

Answer

Let $y = x^3 \log x$

Then,

$$\frac{dy}{dx} = \frac{d}{dx} \left[x^3 \log x \right] = \log x \cdot \frac{d}{dx} \left(x^3 \right) + x^3 \cdot \frac{d}{dx} \left(\log x \right)$$
$$= \log x \cdot 3x^2 + x^3 \cdot \frac{1}{x} = \log x \cdot 3x^2 + x^2$$
$$= x^2 \left(1 + 3 \log x \right)$$
$$\therefore \frac{d^2 y}{dx^2} = \frac{d}{dx} \left[x^2 \left(1 + 3 \log x \right) \right]$$
$$= \left(1 + 3 \log x \right) \cdot \frac{d}{dx} \left(x^2 \right) + x^2 \frac{d}{dx} \left(1 + 3 \log x \right)$$
$$= \left(1 + 3 \log x \right) \cdot 2x + x^2 \cdot \frac{3}{x}$$
$$= 2x + 6x \log x + 3x$$
$$= 5x + 6x \log x$$
$$= x \left(5 + 6 \log x \right)$$

Question 6:

Find the second order derivatives of the function.

$e^x \sin 5x$

Answer

Let $y = e^x \sin 5x$

$$\frac{dy}{dx} = \frac{d}{dx} \left(e^x \sin 5x \right) = \sin 5x \cdot \frac{d}{dx} \left(e^x \right) + e^x \frac{d}{dx} \left(\sin 5x \right)$$

$$= \sin 5x \cdot e^x + e^x \cdot \cos 5x \cdot \frac{d}{dx} (5x) = e^x \sin 5x + e^x \cos 5x \cdot 5$$

$$= e^x \left(\sin 5x + 5 \cos 5x \right)$$

$$\therefore \frac{d^2 y}{dx^2} = \frac{d}{dx} \left[e^x \left(\sin 5x + 5 \cos 5x \right) \right]$$

$$= \left(\sin 5x + 5 \cos 5x \right) \cdot \frac{d}{dx} \left(e^x \right) + e^x \cdot \frac{d}{dx} \left(\sin 5x + 5 \cos 5x \right)$$

$$= \left(\sin 5x + 5 \cos 5x \right) e^x + e^x \left[\cos 5x \cdot \frac{d}{dx} (5x) + 5 \left(-\sin 5x \right) \cdot \frac{d}{dx} (5x) \right]$$

$$= e^x \left(\sin 5x + 5 \cos 5x \right) + e^x \left(5 \cos 5x - 25 \sin 5x \right)$$

$$= e^x \left(10 \cos 5x - 24 \sin 5x \right) = 2e^x \left(5 \cos 5x - 12 \sin 5x \right)$$

Then,

Question 7:

Find the second order derivatives of the function.

 $e^{6x}\cos 3x$

Answer

Let $y = e^{6x} \cos 3x$

Then,

Question 8:

Find the second order derivatives of the function.

 $\tan^{-1}x$

Answer

Let $y = \tan^{-1} x$ Then,

$$\frac{dy}{dx} = \frac{d}{dx} (\tan^{-1} x) = \frac{1}{1+x^2}$$

$$\therefore \frac{d^2 y}{dx^2} = \frac{d}{dx} \left(\frac{1}{1+x^2}\right) = \frac{d}{dx} (1+x^2)^{-1} = (-1) \cdot (1+x^2)^{-2} \cdot \frac{d}{dx} (1+x^2)$$

$$= \frac{-1}{(1+x^2)^2} \times 2x = \frac{-2x}{(1+x^2)^2}$$

Question 9:

Find the second order derivatives of the function.

 $\log(\log x)$

Answer

Let
$$y = \log(\log x)$$

Then,

$$\frac{dy}{dx} = \frac{d}{dx} \Big[\log(\log x) \Big] = \frac{1}{\log x} \cdot \frac{d}{dx} (\log x) = \frac{1}{x \log x} = (x \log x)^{-1}$$
$$\therefore \frac{d^2 y}{dx^2} = \frac{d}{dx} \Big[(x \log x)^{-1} \Big] = (-1) \cdot (x \log x)^{-2} \cdot \frac{d}{dx} (x \log x)$$
$$= \frac{-1}{(x \log x)^2} \cdot \Big[\log x \cdot \frac{d}{dx} (x) + x \cdot \frac{d}{dx} (\log x) \Big]$$
$$= \frac{-1}{(x \log x)^2} \cdot \Big[\log x \cdot 1 + x \cdot \frac{1}{x} \Big] = \frac{-(1 + \log x)}{(x \log x)^2}$$

Question 10:

Find the second order derivatives of the function.

 $\sin(\log x)$

Answer

Let
$$y = \sin(\log x)$$

Then,

$$\frac{dy}{dx} = \frac{d}{dx} \left[\sin(\log x) \right] = \cos(\log x) \cdot \frac{d}{dx} (\log x) = \frac{\cos(\log x)}{x}$$
$$\therefore \frac{d^2 y}{dx^2} = \frac{d}{dx} \left[\frac{\cos(\log x)}{x} \right]$$
$$= \frac{x \cdot \frac{d}{dx} \left[\cos(\log x) \right] - \cos(\log x) \cdot \frac{d}{dx} (x)}{x^2}$$
$$= \frac{x \cdot \left[-\sin(\log x) \cdot \frac{d}{dx} (\log x) \right] - \cos(\log x) \cdot 1}{x^2}$$
$$= \frac{-x \sin(\log x) \cdot \frac{1}{x} - \cos(\log x)}{x^2}$$
$$= \frac{-\left[\sin(\log x) + \cos(\log x) \right]}{x^2}$$

Question 11:

If $y = 5\cos x - 3\sin x$, prove that $\frac{d^2y}{dx^2} + y = 0$

Answer

It is given that, $y = 5\cos x - 3\sin x$ Then,

$$\frac{dy}{dx} = \frac{d}{dx}(5\cos x) - \frac{d}{dx}(3\sin x) = 5\frac{d}{dx}(\cos x) - 3\frac{d}{dx}(\sin x)$$
$$= 5(-\sin x) - 3\cos x = -(5\sin x + 3\cos x)$$
$$\therefore \frac{d^2 y}{dx^2} = \frac{d}{dx} \Big[-(5\sin x + 3\cos x) \Big]$$
$$= -\Big[5 \cdot \frac{d}{dx}(\sin x) + 3 \cdot \frac{d}{dx}(\cos x) \Big]$$
$$= -\Big[5\cos x + 3(-\sin x) \Big]$$
$$= -\Big[5\cos x - 3\sin x \Big]$$
$$= -y$$
$$\therefore \frac{d^2 y}{dx^2} + y = 0$$

Hence, proved.

Question 12:

If $y = \cos^{-1} x$, find $\frac{d^2 y}{dx^2}$ in terms of y alone. Answer It is given that, $y = \cos^{-1} x$

Then,

$$\frac{dy}{dx} = \frac{d}{dx} (\cos^{-1} x) = \frac{-1}{\sqrt{1 - x^2}} = -(1 - x^2)^{\frac{-1}{2}}$$
$$\frac{d^2 y}{dx^2} = \frac{d}{dx} \left[-(1 - x^2)^{\frac{-1}{2}} \right]$$
$$= -\left(-\frac{1}{2}\right) \cdot (1 - x^2)^{\frac{-3}{2}} \cdot \frac{d}{dx} (1 - x^2)$$
$$= \frac{1}{2\sqrt{(1 - x^2)^3}} \times (-2x)$$
$$\Rightarrow \frac{d^2 y}{dx^2} = \frac{-x}{\sqrt{(1 - x^2)^3}} \qquad \dots (i)$$

$$y = \cos^{-1} x \Longrightarrow x = \cos y$$

Putting $x = \cos y$ in equation (i), we obtain

$$\frac{d^2 y}{dx^2} = \frac{-\cos y}{\sqrt{\left(1 - \cos^2 y\right)^3}}$$
$$\Rightarrow \frac{d^2 y}{dx^2} = \frac{-\cos y}{\sqrt{\left(\sin^2 y\right)^3}}$$
$$= \frac{-\cos y}{\sin^3 y}$$
$$= \frac{-\cos y}{\sin y} \times \frac{1}{\sin^2 y}$$
$$\Rightarrow \frac{d^2 y}{dx^2} = -\cot y \cdot \csc^2 y$$

Question 13:

If $y = 3\cos(\log x) + 4\sin(\log x)$, show that $x^2y_2 + xy_1 + y = 0$

Answer

It is given that, $y = 3\cos(\log x) + 4\sin(\log x)$ Then,

$$y_{1} = 3 \cdot \frac{d}{dx} \Big[\cos(\log x) \Big] + 4 \cdot \frac{d}{dx} \Big[\sin(\log x) \Big]$$

$$= 3 \cdot \Big[-\sin(\log x) \cdot \frac{d}{dx} (\log x) \Big] + 4 \cdot \Big[\cos(\log x) \cdot \frac{d}{dx} (\log x) \Big]$$

$$\therefore y_{1} = \frac{-3\sin(\log x)}{x} + \frac{4\cos(\log x)}{x} = \frac{4\cos(\log x) - 3\sin(\log x)}{x}$$

$$\therefore y_{2} = \frac{d}{dx} \Big(\frac{4\cos(\log x) - 3\sin(\log x)}{x} \Big) \Big)$$

$$= \frac{x \{4\cos(\log x) - 3\sin(\log x)\}' - \{4\cos(\log x) - 3\sin(\log x)\}(x)' - [4\cos(\log x) - 3\sin(\log x)](x)'}{x^{2}}$$

$$= \frac{x \Big[4 \{\cos(\log x)\}' - 3 \{\sin(\log x)\}' \Big] - [4\cos(\log x) - 3\sin(\log x)] (\log x) - 3 \sin(\log x) \Big] \cdot 1}{x^{2}}$$

$$= \frac{x \Big[-4\sin(\log x) \cdot (\log x)' - 3\cos(\log x) \cdot (\log x)' \Big] - 4\cos(\log x) + 3\sin(\log x)}{x^{2}}$$

$$= \frac{x \Big[-4\sin(\log x) \cdot \frac{1}{x} - 3\cos(\log x) \cdot \frac{1}{x} \Big] - 4\cos(\log x) + 3\sin(\log x)}{x^{2}}$$

$$= \frac{-4\sin(\log x) - 3\cos(\log x) - 4\cos(\log x) + 3\sin(\log x)}{x^{2}}$$

$$= \frac{-4\sin(\log x) - 3\cos(\log x) - 4\cos(\log x) + 3\sin(\log x)}{x^{2}}$$

$$= \frac{-\sin(\log x) - 7\cos(\log x)}{x^{2}} + x \Big[4\cos(\log x) - 3\sin(\log x) \Big] + 3\cos(\log x) + 4\sin(\log x)$$

$$= -\sin(\log x) - 7\cos(\log x) + 4\cos(\log x) - 3\sin(\log x) + 3\cos(\log x) + 4\sin(\log x)$$

$$= -\sin(\log x) - 7\cos(\log x) + 4\cos(\log x) - 3\sin(\log x) + 3\cos(\log x) + 4\sin(\log x)$$

$$= 0$$
Hence, proved.

Question 14:

If
$$y = Ae^{mx} + Be^{nx}$$
, show that $\frac{d^2y}{dx^2} - (m+n)\frac{dy}{dx} + mny = 0$

Answer

It is given that, $y = Ae^{mx} + Be^{nx}$ Then, $\frac{dy}{dx} = A \cdot \frac{d}{dx} (e^{nx}) + B \cdot \frac{d}{dx} (e^{nx}) = A \cdot e^{mx} \cdot \frac{d}{dx} (mx) + B \cdot e^{nx} \cdot \frac{d}{dx} (nx) = Ame^{mx} + Bne^{nx}$ $\frac{d^2 y}{dx^2} = \frac{d}{dx} (Ame^{mx} + Bne^{nx}) = Am \cdot \frac{d}{dx} (e^{mx}) + Bn \cdot \frac{d}{dx} (e^{nx})$ $= Am \cdot e^{mx} \cdot \frac{d}{dx} (mx) + Bn \cdot e^{nx} \cdot \frac{d}{dx} (nx) = Am^2 e^{mx} + Bn^2 e^{nx}$ $\therefore \frac{d^2 y}{dx^2} - (m+n)\frac{dy}{dx} + mny$ $= Am^2 e^{mx} + Bn^2 e^{nx} - (m+n) \cdot (Ame^{mx} + Bne^{nx}) + mn (Ae^{mx} + Be^{nx})$ $= Am^2 e^{mx} + Bn^2 e^{nx} - Am^2 e^{mx} - Bmne^{mx} - Amne^{mx} - Bn^2 e^{nx} + Amne^{mx} + Bmne^{nx}$ = 0

Hence, proved.

Question 15:

If $y = 500e^{7x} + 600e^{-7x}$, show that $\frac{d^2y}{dx^2} = 49y$

Answer

It is given that, $y = 500e^{7x} + 600e^{-7x}$ Then,

$$\frac{dy}{dx} = 500 \cdot \frac{d}{dx} (e^{7x}) + 600 \cdot \frac{d}{dx} (e^{-7x})$$

$$= 500 \cdot e^{7x} \cdot \frac{d}{dx} (7x) + 600 \cdot e^{-7x} \cdot \frac{d}{dx} (-7x)$$

$$= 3500e^{7x} - 4200e^{-7x}$$

$$\therefore \frac{d^2 y}{dx^2} = 3500 \cdot \frac{d}{dx} (e^{7x}) - 4200 \cdot \frac{d}{dx} (e^{-7x})$$

$$= 3500 \cdot e^{7x} \cdot \frac{d}{dx} (7x) - 4200 \cdot e^{-7x} \cdot \frac{d}{dx} (-7x)$$

$$= 7 \times 3500 \cdot e^{7x} + 7 \times 4200 \cdot e^{-7x}$$

$$= 49 \times 500e^{7x} + 49 \times 600e^{-7x}$$

$$= 49 (500e^{7x} + 600e^{-7x})$$

$$= 49y$$

Hence, proved.

Question 16:

If
$$e^{y}(x+1) = 1$$
, show that $\frac{d^{2}y}{dx^{2}} = \left(\frac{dy}{dx}\right)^{2}$

Answer

The given relationship is $e^{y}(x+1)=1$

$$e^{y}(x+1) = 1$$
$$\Rightarrow e^{y} = \frac{1}{x+1}$$

Taking logarithm on both the sides, we obtain

$$y = \log \frac{1}{(x+1)}$$

Differentiating this relationship with respect to x, we obtain

$$\frac{dy}{dx} = (x+1)\frac{d}{dx}\left(\frac{1}{x+1}\right) = (x+1)\cdot\frac{-1}{(x+1)^2} = \frac{-1}{x+1}$$
$$\therefore \frac{d^2y}{dx^2} = -\frac{d}{dx}\left(\frac{1}{x+1}\right) = -\left(\frac{-1}{(x+1)^2}\right) = \frac{1}{(x+1)^2}$$
$$\Rightarrow \frac{d^2y}{dx^2} = \left(\frac{-1}{x+1}\right)^2$$
$$\Rightarrow \frac{d^2y}{dx^2} = \left(\frac{dy}{dx}\right)^2$$

Hence, proved.

Question 17:

If
$$y = (\tan^{-1} x)^2$$
, show that $(x^2 + 1)^2 y_2 + 2x(x^2 + 1)y_1 = 2$

Answer

The given relationship is $y = (\tan^{-1} x)^2$ Then,

$$y_1 = 2 \tan^{-1} x \frac{d}{dx} (\tan^{-1} x)$$
$$\Rightarrow y_1 = 2 \tan^{-1} x \cdot \frac{1}{1 + x^2}$$
$$\Rightarrow (1 + x^2) y_1 = 2 \tan^{-1} x$$

Again differentiating with respect to x on both the sides, we obtain

$$(1+x^2)y_2 + 2xy_1 = 2\left(\frac{1}{1+x^2}\right)$$

 $\Rightarrow (1+x^2)^2 y_2 + 2x(1+x^2)y_1 = 2$

Hence, proved.

Exercise 5.8

Question 1:

Verify Rolle's Theorem for the function $f(x) = x^2 + 2x - 8$, $x \in [-4, 2]$ Answer

The given function, $f(x) = x^2 + 2x - 8$, being a polynomial function, is continuous in [-4, 2] and is differentiable in (-4, 2). $f(-4) = (-4)^2 + 2 \times (-4) - 8 = 16 - 8 - 8 = 0$ $f(2) = (2)^2 + 2 \times 2 - 8 = 4 + 4 - 8 = 0$

$$\therefore f(-4) = f(2) = 0$$

⇒ The value of f(x) at -4 and 2 coincides.

Rolle's Theorem states that there is a point $c \in (-4, 2)$ such that f'(c) = 0

$$f(x) = x^{2} + 2x - 8$$

$$\Rightarrow f'(x) = 2x + 2$$

$$\therefore f'(c) = 0$$

$$\Rightarrow 2c + 2 = 0$$

$$\Rightarrow c = -1, \text{ where } c = -1 \in (-4, 2)$$

Hence, Rolle's Theorem is verified for the given function.

Question 2:

- / >

Examine if Rolle's Theorem is applicable to any of the following functions. Can you say some thing about the converse of Rolle's Theorem from these examples?

(i)
$$f(x) = [x]$$
 for $x \in [5, 9]$
(ii) $f(x) = [x]$ for $x \in [-2, 2]$
(iii) $f(x) = x^2 - 1$ for $x \in [1, 2]$
Answer
By Rolle's Theorem, for a function $f:[a, b] \rightarrow \mathbf{R}$, if
(a) f is continuous on $[a, b]$

Γ.,

(b) *f* is differentiable on (*a*, *b*)

(c)
$$f(a) = f(b)$$

then, there exists some $c \in (a, b)$ such that f'(c) = 0

Therefore, Rolle's Theorem is not applicable to those functions that do not satisfy any of the three conditions of the hypothesis.

(i) f(x) = [x] for $x \in [5, 9]$

It is evident that the given function f(x) is not continuous at every integral point. In particular, f(x) is not continuous at x = 5 and x = 9

 \Rightarrow *f*(*x*) is not continuous in [5, 9].

Also, f(5) = [5] = 5 and f(9) = [9] = 9 $\therefore f(5) \neq f(9)$

The differentiability of f in (5, 9) is checked as follows.

Let *n* be an integer such that $n \in (5, 9)$.

The left hand limit of f at x = n is, $\lim_{h \to 0^{-}} \frac{f(n+h) - f(n)}{h} = \lim_{h \to 0^{-}} \frac{[n+h] - [n]}{h} = \lim_{h \to 0^{-}} \frac{n-1-n}{h} = \lim_{h \to 0^{-}} \frac{-1}{h} = \infty$ The right hand limit of f at x = n is, $\lim_{h \to 0^{-}} \frac{f(n+h) - f(n)}{h} = \lim_{h \to 0^{-}} \frac{[n+h] - [n]}{h} = \lim_{h \to 0^{-}} \frac{n-n}{h} = \lim_{h \to 0^{-}} 0 = 0$

Since the left and right hand limits of f at x = n are not equal, f is not differentiable at x = n

 $\therefore f$ is not differentiable in (5, 9).

It is observed that *f* does not satisfy all the conditions of the hypothesis of Rolle's Theorem.

Hence, Rolle's Theorem is not applicable for f(x) = [x] for $x \in [5, 9]$. (ii) f(x) = [x] for $x \in [-2, 2]$

It is evident that the given function f(x) is not continuous at every integral point. In particular, f(x) is not continuous at x = -2 and x = 2

 \Rightarrow *f*(*x*) is not continuous in [-2, 2].

Also,
$$f(-2) = [-2] = -2$$
 and $f(2) = [2] = 2$
 $\therefore f(-2) \neq f(2)$

The differentiability of f in (-2, 2) is checked as follows.

Let *n* be an integer such that $n \in (-2, 2)$.

The left hand limit of
$$f$$
 at $x = n$ is,

$$\lim_{h \to 0^{-}} \frac{f(n+h) - f(n)}{h} = \lim_{h \to 0^{-}} \frac{[n+h] - [n]}{h} = \lim_{h \to 0^{-}} \frac{n-1-n}{h} = \lim_{h \to 0^{-}} \frac{-1}{h} = \infty$$
The right hand limit of f at $x = n$ is,

$$\lim_{h \to 0^{+}} \frac{f(n+h) - f(n)}{h} = \lim_{h \to 0^{+}} \frac{[n+h] - [n]}{h} = \lim_{h \to 0^{+}} \frac{n-n}{h} = \lim_{h \to 0^{+}} 0 = 0$$

Since the left and right hand limits of f at x = n are not equal, f is not differentiable at x = n

 $\therefore f$ is not differentiable in (-2, 2).

It is observed that *f* does not satisfy all the conditions of the hypothesis of Rolle's Theorem.

Hence, Rolle's Theorem is not applicable for f(x) = [x] for $x \in [-2, 2]$.

(iii)
$$f(x) = x^2 - 1$$
 for $x \in [1, 2]$

It is evident that f, being a polynomial function, is continuous in [1, 2] and is differentiable in (1, 2).

$$f(1) = (1)^2 - 1 = 0$$

 $f(2) = (2)^2 - 1 = 3$

 $\therefore f\left(1\right) \neq f\left(2\right)$

It is observed that *f* does not satisfy a condition of the hypothesis of Rolle's Theorem.

Hence, Rolle's Theorem is not applicable for $f(x) = x^2 - 1$ for $x \in [1, 2]$.

Question 3:

If $f:[-5,5] \rightarrow \mathbf{R}$ is a differentiable function and if f'(x) does not vanish anywhere, then prove that $f(-5) \neq f(5)$. Answer It is given that $f:[-5,5] \rightarrow \mathbf{R}$ is a differentiable function. Since every differentiable function is a continuous function, we obtain (a) f is continuous on [-5, 5].

(b) f is differentiable on (-5, 5).

Therefore, by the Mean Value Theorem, there exists $c \in (-5, 5)$ such that

$$f'(c) = \frac{f(5) - f(-5)}{5 - (-5)}$$

$$\Rightarrow 10f'(c) = f(5) - f(-5)$$

It is also given that f'(x) does not vanish anywhere.

)

$$\therefore f'(c) \neq 0$$

$$\Rightarrow 10 f'(c) \neq 0$$

$$\Rightarrow f(5) - f(-5) \neq 0$$

$$\Rightarrow f(5) \neq f(-5)$$

Hence, proved.

Question 4:

Verify Mean Value Theorem, if $f(x) = x^2 - 4x - 3$ in the interval $\begin{bmatrix} a, b \end{bmatrix}$, where a = 1 and b = 4.

Answer

The given function is $f(x) = x^2 - 4x - 3$

f, being a polynomial function, is continuous in [1, 4] and is differentiable in (1, 4) whose derivative is 2x - 4.

$$f(1) = 1^{2} - 4 \times 1 - 3 = -6, f(4) = 4^{2} - 4 \times 4 - 3 = -3$$

$$\therefore \frac{f(b) - f(a)}{b - a} = \frac{f(4) - f(1)}{4 - 1} = \frac{-3 - (-6)}{3} = \frac{3}{3} = 1$$

Mean Value Theorem states that there is a point $c \in (1, 4)$ such that f'(c) = 1

$$f'(c) = 1$$

$$\Rightarrow 2c - 4 = 1$$

$$\Rightarrow c = \frac{5}{2}, \text{ where } c = \frac{5}{2} \in (1, 4)$$

Hence, Mean Value Theorem is verified for the given function.

Question 5:

Verify Mean Value Theorem, if $f(x) = x^3 - 5x^2 - 3x$ in the interval [a, b], where a = 1 and b = 3. Find all $c \in (1,3)$ for which f'(c) = 0Answer

The given function f is $f(x) = x^3 - 5x^2 - 3x$

f, being a polynomial function, is continuous in [1, 3] and is differentiable in (1, 3) whose derivative is $3x^2 - 10x - 3$.

$$f(1) = 1^{3} - 5 \times 1^{2} - 3 \times 1 = -7, \quad f(3) = 3^{3} - 5 \times 3^{2} - 3 \times 3 = -27$$

$$\therefore \frac{f(b) - f(a)}{b - a} = \frac{f(3) - f(1)}{3 - 1} = \frac{-27 - (-7)}{3 - 1} = -10$$

Mean Value Theorem states that there exist a point $c \in (1, 3)$ such that f'(c) = -10

$$f'(c) = -10$$

$$\Rightarrow 3c^{2} - 10c - 3 = 10$$

$$\Rightarrow 3c^{2} - 10c + 7 = 0$$

$$\Rightarrow 3c^{2} - 3c - 7c + 7 = 0$$

$$\Rightarrow 3c(c-1) - 7(c-1) = 0$$

$$\Rightarrow (c-1)(3c-7) = 0$$

$$\Rightarrow c = 1, \frac{7}{3}, \text{ where } c = \frac{7}{3} \in (1, 3)$$

Hence, Mean Value Theorem is verified for the given function and $c = \frac{7}{3} \in (1, 3)$ is the only point for which f'(c) = 0

Question 6:

Examine the applicability of Mean Value Theorem for all three functions given in the above exercise 2.

Answer

Mean Value Theorem states that for a function ${}^{f:[a, b] \rightarrow \mathbf{R}}$, if

- (a) f is continuous on [a, b]
- (b) f is differentiable on (a, b)

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

then, there exists some $c \in (a, b)$ such that

Therefore, Mean Value Theorem is not applicable to those functions that do not satisfy any of the two conditions of the hypothesis.

(i)
$$f(x) = [x] \text{ for } x \in [5, 9]$$

It is evident that the given function f(x) is not continuous at every integral point. In particular, f(x) is not continuous at x = 5 and x = 9

 \Rightarrow *f*(*x*) is not continuous in [5, 9].

The differentiability of *f* in (5, 9) is checked as follows.

Let *n* be an integer such that $n \in (5, 9)$.

The left hand limit of f at x = n is,

$$\lim_{h \to 0^{-}} \frac{f(n+h) - f(n)}{h} = \lim_{h \to 0^{-}} \frac{[n+h] - [n]}{h} = \lim_{h \to 0^{-}} \frac{n-1-n}{h} = \lim_{h \to 0^{-}} \frac{-1}{h} = \infty$$

The right hand limit of f at x = n is,

$$\lim_{h \to 0^+} \frac{f(n+h) - f(n)}{h} = \lim_{h \to 0^+} \frac{[n+h] - [n]}{h} = \lim_{h \to 0^+} \frac{n-n}{h} = \lim_{h \to 0^+} 0 = 0$$

Since the left and right hand limits of f at x = n are not equal, f is not differentiable at x = n

 $\therefore f$ is not differentiable in (5, 9).

It is observed that *f* does not satisfy all the conditions of the hypothesis of Mean Value Theorem.

Hence, Mean Value Theorem is not applicable for f(x) = [x] for $x \in [5, 9]$.

(ii)
$$f(x) = [x]$$
 for $x \in [-2, 2]$

It is evident that the given function f(x) is not continuous at every integral point.

In particular, f(x) is not continuous at x = -2 and x = 2

 \Rightarrow *f*(*x*) is not continuous in [-2, 2].

The differentiability of f in (-2, 2) is checked as follows.

Let *n* be an integer such that $n \in (-2, 2)$.

The left hand limit of f at x = n is,

$$\lim_{h \to 0^{-}} \frac{f(n+h) - f(n)}{h} = \lim_{h \to 0^{-}} \frac{[n+h] - [n]}{h} = \lim_{h \to 0^{-}} \frac{n-1-n}{h} = \lim_{h \to 0^{-}} \frac{-1}{h} = \infty$$

The right hand limit of f at $x = n$ is,
$$\lim_{h \to 0^{+}} \frac{f(n+h) - f(n)}{h} = \lim_{h \to 0^{+}} \frac{[n+h] - [n]}{h} = \lim_{h \to 0^{+}} \frac{n-n}{h} = \lim_{h \to 0^{+}} 0 = 0$$

Since the left and right hand limits of f at x = n are not equal, f is not differentiable at x = n

 $\therefore f$ is not differentiable in (-2, 2).

It is observed that *f* does not satisfy all the conditions of the hypothesis of Mean Value Theorem.

Hence, Mean Value Theorem is not applicable for f(x) = [x] for $x \in [-2, 2]$.

(iii)
$$f(x) = x^2 - 1 \text{ for } x \in [1, 2]$$

It is evident that f, being a polynomial function, is continuous in [1, 2] and is differentiable in (1, 2).

It is observed that *f* satisfies all the conditions of the hypothesis of Mean Value Theorem.

Hence, Mean Value Theorem is applicable for $f(x) = x^2 - 1$ for $x \in [1, 2]$. It can be proved as follows.

$$f(1) = 1^{2} - 1 = 0, \ f(2) = 2^{2} - 1 = 3$$

$$\therefore \frac{f(b) - f(a)}{b - a} = \frac{f(2) - f(1)}{2 - 1} = \frac{3 - 0}{1} = 3$$

$$f'(x) = 2x$$

$$\therefore f'(c) = 3$$

$$\Rightarrow 2c = 3$$

$$\Rightarrow c = \frac{3}{2} = 1.5, \text{ where } 1.5 \in [1, 2]$$

Question 1:

$$\left(3x^2-9x+5\right)^9$$

Answer

Let
$$y = (3x^2 - 9x + 5)^9$$

Using chain rule, we obtain

$$\frac{dy}{dx} = \frac{d}{dx} (3x^2 - 9x + 5)^9$$

= 9(3x^2 - 9x + 5)⁸ $\cdot \frac{d}{dx} (3x^2 - 9x + 5)$
= 9(3x² - 9x + 5)⁸ $\cdot (6x - 9)$
= 9(3x² - 9x + 5)⁸ $\cdot 3(2x - 3)$
= 27(3x² - 9x + 5)⁸ (2x - 3)

Question 2:

$$\sin^3 x + \cos^6 x$$

Answer

Let
$$y = \sin^3 x + \cos^6 x$$

$$\therefore \frac{dy}{dx} = \frac{d}{dx} (\sin^3 x) + \frac{d}{dx} (\cos^6 x)$$

$$= 3\sin^2 x \cdot \frac{d}{dx} (\sin x) + 6\cos^5 x \cdot \frac{d}{dx} (\cos x)$$

$$= 3\sin^2 x \cdot \cos x + 6\cos^5 x \cdot (-\sin x)$$

$$= 3\sin x \cos x (\sin x - 2\cos^4 x)$$

Question 3:

 $(5x)^{3\cos 2x}$

Answer

Let
$$y = (5x)^{3\cos 2x}$$

Taking logarithm on both the sides, we obtain

 $\log y = 3\cos 2x\log 5x$

Differentiating both sides with respect to x, we obtain

$$\frac{1}{y}\frac{dy}{dx} = 3\left[\log 5x \cdot \frac{d}{dx}(\cos 2x) + \cos 2x \cdot \frac{d}{dx}(\log 5x)\right]$$

$$\Rightarrow \frac{dy}{dx} = 3y\left[\log 5x(-\sin 2x) \cdot \frac{d}{dx}(2x) + \cos 2x \cdot \frac{1}{5x} \cdot \frac{d}{dx}(5x)\right]$$

$$\Rightarrow \frac{dy}{dx} = 3y\left[-2\sin 2x \log 5x + \frac{\cos 2x}{x}\right]$$

$$\Rightarrow \frac{dy}{dx} = 3y\left[\frac{3\cos 2x}{x} - 6\sin 2x \log 5x\right]$$

$$\therefore \frac{dy}{dx} = (5x)^{3\cos 2x}\left[\frac{3\cos 2x}{x} - 6\sin 2x \log 5x\right]$$

Question 4:

$$\sin^{-1}\left(x\sqrt{x}\right), \ 0 \le x \le 1$$

Answer

Let
$$y = \sin^{-1}\left(x\sqrt{x}\right)$$

Using chain rule, we obtain

$$\frac{dy}{dx} = \frac{d}{dx} \sin^{-1} \left(x \sqrt{x} \right)$$
$$= \frac{1}{\sqrt{1 - \left(x \sqrt{x} \right)^2}} \times \frac{d}{dx} \left(x \sqrt{x} \right)$$
$$= \frac{1}{\sqrt{1 - x^3}} \cdot \frac{d}{dx} \left(x^{\frac{3}{2}} \right)$$
$$= \frac{1}{\sqrt{1 - x^3}} \times \frac{3}{2} \cdot x^{\frac{1}{2}}$$
$$= \frac{3\sqrt{x}}{2\sqrt{1 - x^3}}$$
$$= \frac{3}{2} \sqrt{\frac{x}{1 - x^3}}$$

Question 5:

$$\frac{\cos^{-1}\frac{x}{2}}{\sqrt{2x+7}}, \ -2 < x < 2$$

Let
$$y = \frac{\cos^{-1} \frac{x}{2}}{\sqrt{2x+7}}$$

By quotient rule, we obtain

$$\frac{dy}{dx} = \frac{\sqrt{2x+7} \frac{d}{dx} \left(\cos^{-1} \frac{x}{2}\right) - \left(\cos^{-1} \frac{x}{2}\right) \frac{d}{dx} (\sqrt{2x+7})}{(\sqrt{2x+7})^2}$$

$$= \frac{\sqrt{2x+7} \left[\frac{-1}{\sqrt{1-\left(\frac{x}{2}\right)^2}} \cdot \frac{d}{dx} \left(\frac{x}{2}\right)\right] - \left(\cos^{-1} \frac{x}{2}\right) \frac{1}{2\sqrt{2x+7}} \cdot \frac{d}{dx} (2x+7)$$

$$= \frac{\sqrt{2x+7} - 1}{\sqrt{4-x^2} - \left(\cos^{-1} \frac{x}{2}\right) \frac{2}{2\sqrt{2x+7}}}{2x+7}$$

$$= \frac{-\sqrt{2x+7}}{\sqrt{4-x^2} \times (2x+7)} - \frac{\cos^{-1} \frac{x}{2}}{(\sqrt{2x+7})(2x+7)}$$

$$= -\left[\frac{1}{\sqrt{4-x^2} \sqrt{2x+7}} + \frac{\cos^{-1} \frac{x}{2}}{(2x+7)^2}\right]$$

Question 6:

$$\cot^{-1}\left[\frac{\sqrt{1+\sin x} + \sqrt{1-\sin x}}{\sqrt{1+\sin x} - \sqrt{1-\sin x}}\right], 0 < x < \frac{1}{2}$$

Answer

Let
$$y = \cot^{-1}\left[\frac{\sqrt{1+\sin x} + \sqrt{1-\sin x}}{\sqrt{1+\sin x} - \sqrt{1-\sin x}}\right]$$
 ...(1)
Then, $\frac{\sqrt{1+\sin x} + \sqrt{1-\sin x}}{\sqrt{1+\sin x} - \sqrt{1-\sin x}}$

$$= \frac{\left(\sqrt{1+\sin x} + \sqrt{1-\sin x}\right)^2}{\left(\sqrt{1+\sin x} - \sqrt{1-\sin x}\right)\left(\sqrt{1+\sin x} + \sqrt{1-\sin x}\right)}$$

$$= \frac{(1+\sin x) + (1-\sin x) + 2\sqrt{(1-\sin x)(1+\sin x)}}{(1+\sin x) - (1-\sin x)}$$

$$= \frac{2+2\sqrt{1-\sin^2 x}}{2\sin x}$$

$$= \frac{1+\cos x}{\sin x}$$

$$= \frac{2\cos^2 \frac{x}{2}}{2\sin \frac{x}{2}\cos \frac{x}{2}}$$

$$= \cot \frac{x}{2}$$

Therefore, equation (1) becomes

$$y = \cot^{-1}\left(\cot\frac{x}{2}\right)$$
$$\Rightarrow y = \frac{x}{2}$$
$$\therefore \frac{dy}{dx} = \frac{1}{2}\frac{d}{dx}(x)$$
$$\Rightarrow \frac{dy}{dx} = \frac{1}{2}$$

Question 7:

 $(\log x)^{\log x}, x > 1$

Answer

Let $y = (\log x)^{\log x}$

Taking logarithm on both the sides, we obtain

$$\log y = \log x \cdot \log(\log x)$$

Differentiating both sides with respect to x, we obtain

$$\frac{1}{y}\frac{dy}{dx} = \frac{d}{dx} \Big[\log x \cdot \log(\log x) \Big]$$

$$\Rightarrow \frac{1}{y}\frac{dy}{dx} = \log(\log x) \cdot \frac{d}{dx} (\log x) + \log x \cdot \frac{d}{dx} \Big[\log(\log x) \Big]$$

$$\Rightarrow \frac{dy}{dx} = y \Big[\log(\log x) \cdot \frac{1}{x} + \log x \cdot \frac{1}{\log x} \cdot \frac{d}{dx} (\log x) \Big]$$

$$\Rightarrow \frac{dy}{dx} = y \Big[\frac{1}{x} \log(\log x) + \frac{1}{x} \Big]$$

$$\therefore \frac{dy}{dx} = (\log x)^{\log x} \Big[\frac{1}{x} + \frac{\log(\log x)}{x} \Big]$$

Question 8:

 $\cos(a\cos x + b\sin x)$, for some constant *a* and *b*.

Answer

Let
$$y = \cos(a\cos x + b\sin x)$$

By using chain rule, we obtain

$$\frac{dy}{dx} = \frac{d}{dx}\cos(a\cos x + b\sin x)$$
$$\Rightarrow \frac{dy}{dx} = -\sin(a\cos x + b\sin x) \cdot \frac{d}{dx}(a\cos x + b\sin x)$$
$$= -\sin(a\cos x + b\sin x) \cdot [a(-\sin x) + b\cos x]$$
$$= (a\sin x - b\cos x) \cdot \sin(a\cos x + b\sin x)$$

Question 9:

 $(\sin x - \cos x)^{(\sin x - \cos x)}, \ \frac{\pi}{4} < x < \frac{3\pi}{4}$

Answer

Let
$$y = (\sin x - \cos x)^{(\sin x - \cos x)}$$

Taking logarithm on both the sides, we obtain

$$\log y = \log \left[(\sin x - \cos x)^{(\sin x - \cos x)} \right]$$
$$\Rightarrow \log y = (\sin x - \cos x) \cdot \log (\sin x - \cos x)$$

Differentiating both sides with respect to x, we obtain

$$\frac{1}{y}\frac{dy}{dx} = \frac{d}{dx} \Big[(\sin x - \cos x) \log(\sin x - \cos x) \Big]$$

$$\Rightarrow \frac{1}{y}\frac{dy}{dx} = \log(\sin x - \cos x) \cdot \frac{d}{dx} (\sin x - \cos x) + (\sin x - \cos x) \cdot \frac{d}{dx} \log(\sin x - \cos x)$$

$$\Rightarrow \frac{1}{y}\frac{dy}{dx} = \log(\sin x - \cos x) \cdot (\cos x + \sin x) + (\sin x - \cos x) \cdot \frac{1}{(\sin x - \cos x)} \cdot \frac{d}{dx} (\sin x - \cos x)$$

$$\Rightarrow \frac{dy}{dx} = (\sin x - \cos x)^{(\sin x - \cos x)} \Big[(\cos x + \sin x) \cdot \log(\sin x - \cos x) + (\cos x + \sin x) \Big]$$

$$\therefore \frac{dy}{dx} = (\sin x - \cos x)^{(\sin x - \cos x)} (\cos x + \sin x) \Big[1 + \log(\sin x - \cos x) \Big]$$

Question 10:

$$x^{x} + x^{a} + a^{x} + a^{a}$$
, for some fixed $a > 0$ and $x > 0$

Answer

Let
$$y = x^{x} + x^{a} + a^{x} + a^{a}$$

Also, let $x^{x} = u$, $x^{a} = v$, $a^{x} = w$, and $a^{a} = s$
 $\therefore y = u + v + w + s$
 $\Rightarrow \frac{dy}{dx} = \frac{du}{dx} + \frac{dv}{dx} + \frac{dw}{dx} + \frac{ds}{dx}$...(1)
 $u = x^{x}$
 $\Rightarrow \log u = \log x^{x}$
 $\Rightarrow \log u = \log x$

Differentiating both sides with respect to x, we obtain

$$\frac{1}{u}\frac{du}{dx} = \log x \cdot \frac{d}{dx}(x) + x \cdot \frac{d}{dx}(\log x)$$

$$\Rightarrow \frac{du}{dx} = u \left[\log x \cdot 1 + x \cdot \frac{1}{x} \right]$$

$$\Rightarrow \frac{du}{dx} = x^{x} \left[\log x + 1 \right] = x^{x} \left(1 + \log x \right) \qquad \dots(2)$$

$$v = x^{a}$$

$$\therefore \frac{dv}{dx} = \frac{d}{dx} \left(x^{a} \right)$$

$$\Rightarrow \frac{dv}{dx} = ax^{a-1} \qquad \dots(3)$$

$$w = a^{x}$$

$$\Rightarrow \log w = \log a^{x}$$

$$\Rightarrow \log w = x \log a$$

Differentiating both sides with respect to x, we obtain

$$\frac{1}{w} \cdot \frac{dw}{dx} = \log a \cdot \frac{d}{dx}(x)$$

$$\Rightarrow \frac{dw}{dx} = w \log a$$

$$\Rightarrow \frac{dw}{dx} = a^{x} \log a \qquad \dots (4)$$

$$s = a^{a}$$

Since a is constant, a^a is also a constant.

$$\frac{ds}{dx} = 0 \qquad \dots (5)$$

From (1), (2), (3), (4), and (5), we obtain

$$\frac{dy}{dx} = x^{x} (1 + \log x) + ax^{a-1} + a^{x} \log a + 0$$
$$= x^{x} (1 + \log x) + ax^{a-1} + a^{x} \log a$$

Question 11:

$$x^{x^2-3} + (x-3)^{x^2}$$
, for $x > 3$

Answer

Let
$$y = x^{x^2-3} + (x-3)^{x^2}$$

Also, let $u = x^{x^2-3}$ and $v = (x-3)^{x^2}$
 $\therefore y = u + v$

Differentiating both sides with respect to x, we obtain

$$\frac{dy}{dx} = \frac{du}{dx} + \frac{dv}{dx} \qquad \dots(1)$$
$$u = x^{x^2 - 3}$$
$$\therefore \log u = \log(x^{x^2 - 3})$$
$$\log u = (x^2 - 3)\log x$$

Differentiating with respect to x, we obtain

$$\frac{1}{u} \cdot \frac{du}{dx} = \log x \cdot \frac{d}{dx} (x^2 - 3) + (x^2 - 3) \cdot \frac{d}{dx} (\log x)$$
$$\Rightarrow \frac{1}{u} \frac{du}{dx} = \log x \cdot 2x + (x^2 - 3) \cdot \frac{1}{x}$$
$$\Rightarrow \frac{du}{dx} = x^{x^2 - 3} \cdot \left[\frac{x^2 - 3}{x} + 2x \log x \right]$$

Also,

$$v = (x-3)^{x^2}$$

$$\therefore \log v = \log (x-3)^{x^2}$$

$$\Rightarrow \log v = x^2 \log (x-3)$$

Differentiating both sides with respect to x, we obtain

$$\frac{1}{v} \cdot \frac{dv}{dx} = \log(x-3) \cdot \frac{d}{dx} (x^2) + x^2 \cdot \frac{d}{dx} \left[\log(x-3) \right]$$

$$\Rightarrow \frac{1}{v} \frac{dv}{dx} = \log(x-3) \cdot 2x + x^2 \cdot \frac{1}{x-3} \cdot \frac{d}{dx} (x-3)$$

$$\Rightarrow \frac{dv}{dx} = v \left[2x \log(x-3) + \frac{x^2}{x-3} \cdot 1 \right]$$

$$\Rightarrow \frac{dv}{dx} = (x-3)^{x^2} \left[\frac{x^2}{x-3} + 2x \log(x-3) \right]$$

Substituting the expressions of
$$\frac{dx}{dx}$$
 and $\frac{dx}{dx}$ in equation (1), we obtain

$$\frac{dy}{dx} = x^{x^2 - 3} \left[\frac{x^2 - 3}{x} + 2x \log x \right] + (x - 3)^{x^2} \left[\frac{x^2}{x - 3} + 2x \log (x - 3) \right]$$

Question 12:

$$\frac{dy}{dx}, \text{ if } y = 12(1 - \cos t), x = 10(t - \sin t), -\frac{\pi}{2} < t < \frac{\pi}{2}$$

Answer

It is given that,
$$y = 12(1 - \cos t), x = 10(t - \sin t)$$

$$\therefore \frac{dx}{dt} = \frac{d}{dt} \Big[10(t - \sin t) \Big] = 10 \cdot \frac{d}{dt} (t - \sin t) = 10(1 - \cos t)$$

$$\frac{dy}{dt} = \frac{d}{dt} \Big[12(1 - \cos t) \Big] = 12 \cdot \frac{d}{dt} (1 - \cos t) = 12 \cdot \Big[0 - (-\sin t) \Big] = 12 \sin t$$

$$\therefore \frac{dy}{dx} = \frac{\left(\frac{dy}{dt}\right)}{\left(\frac{dx}{dt}\right)} = \frac{12 \sin t}{10(1 - \cos t)} = \frac{12 \cdot 2 \sin \frac{t}{2} \cdot \cos \frac{t}{2}}{10 \cdot 2 \sin^2 \frac{t}{2}} = \frac{6}{5} \cot \frac{t}{2}$$

Question 13:

Find $\frac{dy}{dx}$, if $y = \sin^{-1} x + \sin^{-1} \sqrt{1 - x^2}$, $-1 \le x \le 1$ Answer

It is given that,
$$y = \sin^{-1} x + \sin^{-1} \sqrt{1 - x^2}$$

$$\therefore \frac{dy}{dx} = \frac{d}{dx} \left[\sin^{-1} x + \sin^{-1} \sqrt{1 - x^2} \right]$$

$$\Rightarrow \frac{dy}{dx} = \frac{d}{dx} (\sin^{-1} x) + \frac{d}{dx} (\sin^{-1} \sqrt{1 - x^2})$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{\sqrt{1 - x^2}} + \frac{1}{\sqrt{1 - (\sqrt{1 - x^2})^2}} \cdot \frac{d}{dx} (\sqrt{1 - x^2})$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{\sqrt{1 - x^2}} + \frac{1}{x} \cdot \frac{1}{2\sqrt{1 - x^2}} \cdot \frac{d}{dx} (1 - x^2)$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{\sqrt{1 - x^2}} + \frac{1}{2x\sqrt{1 - x^2}} (-2x)$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{\sqrt{1 - x^2}} - \frac{1}{\sqrt{1 - x^2}}$$

$$\therefore \frac{dy}{dx} = 0$$

Question 14:

If
$$x\sqrt{1+y} + y\sqrt{1+x} = 0$$
, for, $-1 < x < 1$, prove that
 $\frac{dy}{dx} = -\frac{1}{(1+x)^2}$

Answer

It is given that, $x\sqrt{1+y} + y\sqrt{1+x} = 0$

$$\Rightarrow x\sqrt{1+y} = -y\sqrt{1+x}$$

Squaring both sides, we obtain
$$x^{2}(1+y) = y^{2}(1+x)$$
$$\Rightarrow x^{2} + x^{2}y = y^{2} + xy^{2}$$
$$\Rightarrow x^{2} - y^{2} = xy^{2} - x^{2}y$$
$$\Rightarrow x^{2} - y^{2} = xy(y-x)$$
$$\Rightarrow (x+y)(x-y) = xy(y-x)$$
$$\therefore x+y = -xy$$
$$\Rightarrow (1+x)y = -x$$
$$\Rightarrow y = \frac{-x}{(1+x)}$$

Differentiating both sides with respect to x, we obtain

$$y = \frac{-x}{(1+x)}$$
$$\frac{dy}{dx} = -\frac{(1+x)\frac{d}{dx}(x) - x\frac{d}{dx}(1+x)}{(1+x)^2} = -\frac{(1+x)-x}{(1+x)^2} = -\frac{1}{(1+x)^2}$$

Hence, proved.

Question 15:

If
$$(x-a)^2 + (y-b)^2 = c^2$$
, for some $c > 0$, prove that

$$\frac{\left[1 + \left(\frac{dy}{dx}\right)^2\right]^{\frac{3}{2}}}{\frac{d^2y}{dx^2}}$$
is a constant independent of *a* and *b*.

Answer

It is given that, $(x-a)^2 + (y-b)^2 = c^2$

Differentiating both sides with respect to x, we obtain

$$\frac{d}{dx}\left[\left(x-a\right)^{2}\right] + \frac{d}{dx}\left[\left(y-b\right)^{2}\right] = \frac{d}{dx}\left(c^{2}\right)$$

$$\Rightarrow 2\left(x-a\right) \cdot \frac{d}{dx}\left(x-a\right) + 2\left(y-b\right) \cdot \frac{d}{dx}\left(y-b\right) = 0$$

$$\Rightarrow 2\left(x-a\right) \cdot 1 + 2\left(y-b\right) \cdot \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{-\left(x-a\right)}{y-b} \qquad \dots(1)$$

$$\therefore \frac{d^{2}y}{dx^{2}} = \frac{d}{dx}\left[\frac{-\left(x-a\right)}{y-b}\right]$$

$$= -\left[\frac{(y-b)\cdot\frac{d}{dx}(x-a)-(x-a)\cdot\frac{d}{dx}(y-b)}{(y-b)^{2}}\right]$$
$$= -\left[\frac{(y-b)-(x-a)\cdot\frac{dy}{dx}}{(y-b)^{2}}\right]$$
$$= -\left[\frac{(y-b)-(x-a)\cdot\left\{-\frac{(x-a)}{y-b}\right\}}{(y-b)^{2}}\right]$$
$$[Using (1)]$$
$$= -\left[\frac{(y-b)^{2}+(x-a)^{2}}{(y-b)^{3}}\right]$$
$$\left[\frac{1+\left(\frac{dy}{dx}\right)^{2}}{\frac{d^{2}y}{dx^{2}}}\right]^{\frac{3}{2}} = \frac{\left[1+\frac{(x-a)^{2}}{(y-b)^{2}}\right]^{\frac{3}{2}}}{-\left[\frac{(y-b)^{2}+(x-a)^{2}}{(y-b)^{3}}\right]} = \frac{\left[\frac{(y-b)^{2}+(x-a)^{2}}{(y-b)^{2}}\right]^{\frac{3}{2}}}{-\left[\frac{(y-b)^{2}+(x-a)^{2}}{(y-b)^{3}}\right]}$$
$$= \frac{\left[\frac{\frac{c^{2}}{(y-b)^{2}}}{-\frac{c^{2}}{(y-b)^{3}}}\right]^{\frac{3}{2}}}{-\frac{c^{3}}{(y-b)^{3}}}$$

Hence, proved.

Question 16:

If $\cos y = x \cos(a+y)$, with $\cos a \neq \pm 1$, prove that $\frac{dy}{dx} = \frac{\cos^2(a+y)}{\sin a}$ Answer It is given that, $\cos y = x \cos(a + y)$

$$\therefore \frac{d}{dx} [\cos y] = \frac{d}{dx} [x \cos(a+y)]$$

$$\Rightarrow -\sin y \frac{dy}{dx} = \cos(a+y) \cdot \frac{d}{dx} (x) + x \cdot \frac{d}{dx} [\cos(a+y)]$$

$$\Rightarrow -\sin y \frac{dy}{dx} = \cos(a+y) + x \cdot [-\sin(a+y)] \frac{dy}{dx}$$

$$\Rightarrow [x \sin(a+y) - \sin y] \frac{dy}{dx} = \cos(a+y) \qquad \dots(1)$$

Since $\cos y = x \cos(a+y), x = \frac{\cos y}{\cos(a+y)}$

Then, equation (1) reduces to

$$\left[\frac{\cos y}{\cos(a+y)} \cdot \sin(a+y) - \sin y\right] \frac{dy}{dx} = \cos(a+y)$$
$$\Rightarrow \left[\cos y \cdot \sin(a+y) - \sin y \cdot \cos(a+y)\right] \cdot \frac{dy}{dx} = \cos^2(a+y)$$
$$\Rightarrow \sin(a+y-y) \frac{dy}{dx} = \cos^2(a+b)$$
$$\Rightarrow \frac{dy}{dx} = \frac{\cos^2(a+b)}{\sin a}$$

Hence, proved.

Question 17:

If
$$x = a(\cos t + t\sin t)_{and} y = a(\sin t - t\cos t)_{r, find} \frac{d^2y}{dx^2}$$

Answer

It is given that, $x = a(\cos t + t \sin t)$ and $y = a(\sin t - t \cos t)$

$$\therefore \frac{dx}{dt} = a \cdot \frac{d}{dt} (\cos t + t \sin t)$$

$$= a \left[-\sin t + \sin t \cdot \frac{d}{dx}(t) + t \cdot \frac{d}{dt}(\sin t) \right]$$

$$= a \left[-\sin t + \sin t + t \cos t \right] = at \cos t$$

$$\frac{dy}{dt} = a \cdot \frac{d}{dt} (\sin t - t \cos t)$$

$$= a \left[\cos t - \left\{ \cos t \cdot \frac{d}{dt}(t) + t \cdot \frac{d}{dt}(\cos t) \right\} \right]$$

$$= a \left[\cos t - \left\{ \cos t - t \sin t \right\} \right] = at \sin t$$

$$\therefore \frac{dy}{dx} = \frac{\left(\frac{dy}{dt} \right)}{\left(\frac{dx}{dt} \right)} = \frac{at \sin t}{at \cos t} = \tan t$$
Then, $\frac{d^2 y}{dx^2} = \frac{d}{dx} \left(\frac{dy}{dx} \right) = \frac{d}{dx} (\tan t) = \sec^2 t \cdot \frac{dt}{dx}$

$$= \sec^2 t \cdot \frac{1}{at \cos t} \qquad \left[\frac{dx}{dt} = at \cos t \Rightarrow \frac{dt}{dx} = \frac{1}{at \cos t} \right]$$

$$= \frac{\sec^3 t}{at}, 0 < t < \frac{\pi}{2}$$

Question 18:

If $f(x) = |x|^3$, show that f''(x) exists for all real x, and find it. Answer

 $\begin{aligned} |x| &= \begin{cases} x, & \text{if } x \ge 0\\ -x, & \text{if } x < 0 \end{cases} \end{aligned}$ Therefore, when $x \ge 0$, $f(x) = |x|^3 = x^3$ In this case, $f'(x) = 3x^2$ and hence, f''(x) = 6xWhen x < 0, $f(x) = |x|^3 = (-x)^3 = -x^3$ In this case, $f'(x) = -3x^2$ and hence, f''(x) = -6xThus, for $f(x) = |x|^3$, f''(x) exists for all real x and is given by, $f''(x) = \begin{cases} 6x, & \text{if } x \ge 0 \\ -6x, & \text{if } x < 0 \end{cases}$

Question 19:

Using mathematical induction prove that $\frac{d}{dx}(x^n) = nx^{n-1}$ for all positive integers *n*. Answer

To prove:
$$P(n): \frac{d}{dx}(x^n) = nx^{n-1}$$
 for all positive integers n

For n = 1,

$$P(1):\frac{d}{dx}(x)=1=1\cdot x^{1-1}$$

 \therefore P(*n*) is true for *n* = 1

Let P(k) is true for some positive integer k.

$$\mathbf{P}(k):\frac{d}{dx}(x^k)=kx^{k-1}$$
 That is,

It has to be proved that P(k + 1) is also true.

Consider
$$\frac{d}{dx}(x^{k+1}) = \frac{d}{dx}(x \cdot x^k)$$

$$= x^k \cdot \frac{d}{dx}(x) + x \cdot \frac{d}{dx}(x^k) \qquad [By applying product rule]$$

$$= x^k \cdot 1 + x \cdot k \cdot x^{k-1}$$

$$= x^k + kx^k$$

$$= (k+1) \cdot x^k$$

$$= (k+1) \cdot x^{(k+1)-1}$$

Thus, P(k + 1) is true whenever P (k) is true.

Therefore, by the principle of mathematical induction, the statement P(n) is true for every positive integer n.

Hence, proved.

Question 20:

Using the fact that sin (A + B) = sin A cos B + cos A sin B and the differentiation, obtain the sum formula for cosines.

Answer

 $\sin(A+B) = \sin A \cos B + \cos A \sin B$

Differentiating both sides with respect to x, we obtain

$$\frac{d}{dx} \left[\sin(A+B) \right] = \frac{d}{dx} (\sin A \cos B) + \frac{d}{dx} (\cos A \sin B)$$

$$\Rightarrow \cos(A+B) \cdot \frac{d}{dx} (A+B) = \cos B \cdot \frac{d}{dx} (\sin A) + \sin A \cdot \frac{d}{dx} (\cos B)$$

$$+ \sin B \cdot \frac{d}{dx} (\cos A) + \cos A \cdot \frac{d}{dx} (\sin B)$$

$$\Rightarrow \cos(A+B) \cdot \frac{d}{dx} (A+B) = \cos B \cdot \cos A \frac{dA}{dx} + \sin A (-\sin B) \frac{dB}{dx}$$

$$+ \sin B (-\sin A) \cdot \frac{dA}{dx} + \cos A \cos B \frac{dB}{dx}$$

$$\Rightarrow \cos(A+B) \cdot \left[\frac{dA}{dx} + \frac{dB}{dx} \right] = (\cos A \cos B - \sin A \sin B) \cdot \left[\frac{dA}{dx} + \frac{dB}{dx} \right]$$

 $\therefore \cos(A+B) = \cos A \cos B - \sin A \sin B$

Question 22:

Answer

$$y = \begin{vmatrix} f(x) & g(x) & h(x) \\ l & m & n \\ a & b & c \end{vmatrix}$$

$$\Rightarrow y = (mc - nb) f(x) - (lc - na) g(x) + (lb - ma) h(x)$$

Then, $\frac{dy}{dx} = \frac{d}{dx} [(mc - nb) f(x)] - \frac{d}{dx} [(lc - na) g(x)] + \frac{d}{dx} [(lb - ma) h(x)]$

$$= (mc - nb) f'(x) - (lc - na) g'(x) + (lb - ma) h'(x)$$

$$= \begin{vmatrix} f'(x) & g'(x) & h'(x) \\ l & m & n \\ a & b & c \end{vmatrix}$$

Thus,

Question 23:

If
$$y = e^{a\cos^{-1}x}$$
, $-1 \le x \le 1$, show that $(1-x^2)\frac{d^2y}{dx^2} - x\frac{dy}{dx} - a^2y = 0$
Answer

It is given that, $y = e^{a\cos^{-1}x}$

Taking logarithm on both the sides, we obtain

$$\log y = a \cos^{-1} x \log e$$

$$\log y = a \cos^{-1} x$$

Differentiating both s

Differentiating both sides with respect to x, we obtain

$$\frac{1}{y}\frac{dy}{dx} = a \times \frac{-1}{\sqrt{1 - x^2}}$$
$$\Rightarrow \frac{dy}{dx} = \frac{-ay}{\sqrt{1 - x^2}}$$

By squaring both the sides, we obtain

$$\left(\frac{dy}{dx}\right)^2 = \frac{a^2 y^2}{1 - x^2}$$
$$\Rightarrow \left(1 - x^2\right) \left(\frac{dy}{dx}\right)^2 = a^2 y^2$$
$$\left(1 - x^2\right) \left(\frac{dy}{dx}\right)^2 = a^2 y^2$$

Again differentiating both sides with respect to x, we obtain

$$\left(\frac{dy}{dx}\right)^{2} \frac{d}{dx} (1-x^{2}) + (1-x^{2}) \times \frac{d}{dx} \left[\left(\frac{dy}{dx}\right)^{2} \right] = a^{2} \frac{d}{dx} (y^{2})$$

$$\Rightarrow \left(\frac{dy}{dx}\right)^{2} (-2x) + (1-x^{2}) \times 2 \frac{dy}{dx} \cdot \frac{d^{2}y}{dx^{2}} = a^{2} \cdot 2y \cdot \frac{dy}{dx}$$

$$\Rightarrow \left(\frac{dy}{dx}\right)^{2} (-2x) + (1-x^{2}) \times 2 \frac{dy}{dx} \cdot \frac{d^{2}y}{dx^{2}} = a^{2} \cdot 2y \cdot \frac{dy}{dx}$$

$$\Rightarrow -x \frac{dy}{dx} + (1-x^{2}) \frac{d^{2}y}{dx^{2}} = a^{2} \cdot y \qquad \left[\frac{dy}{dx} \neq 0\right]$$

$$\Rightarrow (1-x^{2}) \frac{d^{2}y}{dx^{2}} - x \frac{dy}{dx} - a^{2}y = 0$$

Hence, proved.
