

# Quadrilaterals

**Answer :**

- (i) 4
- (ii) 4
- (iii) 4, co-linear
- (iv) 2
- (v) opposite
- (vi)  $360^\circ$

Q2.

**Answer :**

- (i) There are four pairs of adjacent sides, namely  $(AB,BC)$ ,  $(BC,CD)$ ,  $(CD,DA)$  and  $(DA,AB)$ .
- (ii) There are two pairs of opposite sides, namely  $(AB,DC)$  and  $(AD,BC)$ .
- (iii) There are four pairs of adjacent angles, namely  $\angle A, \angle B$ ,  $\angle B, \angle C$ ,  $\angle C, \angle D$  and  $\angle D, \angle A$ .
- (iv) There are two pairs of opposite angles, namely  $\angle A, \angle C$  and  $\angle B, \angle D$ .
- (v) There are two diagonals, namely  $AC$  and  $BD$ .

**Answer :**

Q3.

Let  $ABCD$  be a quadrilateral.  
Join  $A$  and  $C$ .

Now, we know that the sum of the angles of a triangle is  $180^\circ$ .

$$\text{For } \triangle ABC: \angle 2 + \angle 4 + \angle B = 180^\circ \quad \dots (1)$$

$$\text{For } \triangle ADC: \angle 1 + \angle 3 + \angle D = 180^\circ \quad \dots (2)$$

$$\text{For } \triangle ADC: \angle 1 + \angle 3 + \angle D = 180^\circ \quad \dots (2)$$

Adding (1) and (2):

$$(\angle 1 + \angle 2 + \angle 3 + \angle 4) + \angle B + \angle D = 360^\circ$$

$$\text{or } \angle A + \angle B + \angle C + \angle D = 360^\circ$$

Hence, the sum of all the angles of a quadrilateral is  $360^\circ$ .

Q4.

**Answer :**

Sum of all the four angles of a quadrilateral is  $360^\circ$ .

$$\text{Let the unknown angle be } x^\circ. 76 + 54 + 108 + x = 360 \implies 238 + x = 360 \implies x = 122$$

The fourth angle measures  $122^\circ$ .

Q5

**Answer :**

Let the measures of the angles of the given quadrilateral be  $(3x)^\circ, (5x)^\circ, (7x)^\circ$  and  $(9x)^\circ$ .  
Sum of all the angles of a quadrilateral is  $360^\circ$ .  
 $3x + 5x + 7x + 9x = 360 \implies 24x = 360 \implies x = 15$

$$\text{Angles measure: } (3 \times 15)^\circ = 45^\circ, (5 \times 15)^\circ = 75^\circ, (7 \times 15)^\circ = 105^\circ, (9 \times 15)^\circ = 135^\circ$$

Q6

**Answer :**

Sum of the four angles of a quadrilateral is  $360^\circ$ .

If the unknown angle is  $x^\circ$ , then:

$$75 + 75 + 75 + x = 360 \implies 225 + x = 360 \implies x = 135$$

The fourth angle measures  $135^\circ$ .

Q7.

**Answer :**

Let the three angles measure  $x^\circ$  each.

Sum of all the angles of a quadrilateral is  $360^\circ$ .

$$\therefore x+x+x+120=360 \quad 3x+120=360 \quad 3x=240 \quad x=240/3=80$$

Each of the equal angles measure  $80^\circ$ .

∩

**Answer :**

Sum of the angles of a quadrilateral is  $360^\circ$ .

$$\therefore \angle A + \angle B + 60^\circ + 100^\circ = 360^\circ \quad \angle A + \angle B = 360^\circ - 100^\circ - 60^\circ = 200^\circ \text{ or } 12 \angle A + \angle B = 100^\circ \quad \dots (1)$$

Sum of the angles of a triangle is  $180^\circ$ . In  $\triangle APB$ :  $12 \angle A + \angle B + \angle P = 180^\circ$

Using equation (1):  $100^\circ + \angle P = 180^\circ \Rightarrow \angle P = 80^\circ$

$$\therefore \angle APB = 80^\circ$$
