### Complex numbers Ex 13.1 Q1(i)

We know that  $i = \sqrt{-1}$

$$i^2 = -1$$

$$i^3 = -i$$

$$i^4 = 1$$

In order to find  $i^n$  where  $n > 4$ , we divide  $n$  by 4 to get quotient  $p$  and remainder  $q$ , so that  
$$n = 4p + q, 0 \leq q < 4$$

Then  $i^n = i^{4p+q}$

$$= i^{4p} \times i^q$$

$$= (i^4)^p \times i^q$$

$$= 1^p \times i^q$$

$$= i^q \quad [\because 1^{p-1}]$$

Hence  $i^n = i^q$ , where  $0 \leq q < 4$

$$\begin{aligned}\therefore i^{457} &= i^{4 \times 114} \times i^1 \\ &= i^1 \\ &= i\end{aligned}$$

### Complex numbers Ex 13.1 Q1(ii)

We know that  $i = \sqrt{-1}$

$$i^2 = -1$$

$$i^3 = -i$$

$$i^4 = 1$$

$$= 1^p \times i^q$$

$$= i^q \quad [\because 1^{p-1}]$$

Hence  $i^n = i^q$ , where  $0 \leq q < 4$

$$\begin{aligned}\therefore i^{528} &= i^{4 \times 132} \\ &= (i^4)^{132} \\ &= 1^{132} \\ &= 1\end{aligned}$$

$$\therefore (i^{528}) = 1$$

### Complex numbers Ex 13.1 Q1(iii)

We know that  $i = \sqrt{-1}$

$$i^2 = -1$$

$$i^3 = -i$$

$$i^4 = 1$$

$$= (i^4)^p \times i^q$$

$$= 1^p \times i^q$$

$$= i^q \quad [\because 1^{p-1}]$$

Hence  $i^n = i^q$ , where  $0 \leq q < 4$

$$\therefore \frac{1}{i^{58}} = \frac{1}{i^{4 \times 14} \times i^2}$$

$$= \frac{1}{1 \times i^2}$$

$$= \frac{1}{-1} \quad [\because i^2 = -1]$$

$$= -1$$

We know that  $i = \sqrt{-1}$

$$i^2 = -1$$

$$i^3 = -i$$

$$i^4 = 1$$

In order to find  $i^n$  where  $n > 4$ , we divide  $n$  by 4 to get quotient  $p$  and remainder  $q$ , so that

Hence  $i^n = i^q$ , where  $0 \leq q < 4$

$$\begin{aligned} \therefore i^{37} + \frac{1}{i^{67}} &= i^{4 \times 9} \times i^1 + \frac{1}{i^{4 \times 16} \times i^3} \\ &= 1 \times i^1 + \frac{1}{1 \times i^3} \\ &= i + \frac{1}{i^3 \times i} \\ &= i + \frac{i}{i^4} \\ &= i + \frac{i}{1} \quad [\because i^4 = 1] \\ &= 2i \end{aligned}$$

$$\therefore i^{37} + \frac{1}{i^{67}} = 2i$$

We know that  $i = \sqrt{-1}$

$$i^2 = -1$$

$$i^3 = -i$$

$$= 1^p \times i^q$$

Hence  $i^n = i^q$ , where  $0 \leq q < 4$

$$\begin{aligned} \left(i^{41} + \frac{1}{i^{257}}\right)^9 &= \left(i^{4 \times 10} \times i^1 + \frac{1}{i^{4 \times 64} \times i^1}\right)^9 \\ &= \left(1 \times i + \frac{1}{1 \times i}\right)^9 \\ &= \left(i + \frac{1}{i}\right)^9 \\ &= \left(i + \frac{1}{i \times i} \times i\right)^9 \\ &= \left(i + \frac{i}{-1}\right)^9 \\ &= (i - i)^9 \\ &= 0 \end{aligned}$$

We know that  $i = \sqrt{-1}$

$$i^2 = -1$$

$$i^3 = -i$$

$$i^4 = 1$$

Hence  $i^n = i^q$ , where  $0 \leq q < 4$

$$\begin{aligned}(i^{77} + i^{70} + i^{87} + i^{414})^3 &= (i^{4 \times 19} \times i^1 + i^{4 \times 17} \times i^2 + i^{4 \times 21} \times i^3 + i^{4 \times 103} \times i^2)^3 \\ &= (1 \times i + 1 \times i^2 + 1 \times i^3 + 1 \times i^2)^3 \\ &= (i - 1 - i - 1)^3 \\ &= (-2)^3 \\ &= -8\end{aligned}$$
