Chapter 11
Ex 11.1

Chapter: Differentiation

Exercise: 11.1

Page Number: 11.17

Question 1.

Solution:

Consider $f(x) = e^{-x}$

$$\Rightarrow f(x+h) = e^{-(x+h)}$$

$$\frac{d}{dx}(f(x)) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{e^{-(x+h)} - e^{-x}}{h}$$

$$= \lim_{h \rightarrow 0} \frac{e^{-x} \times e^{-h} - e^{-x}}{h}$$

$$= \lim_{h \rightarrow 0} e^{-x} \left\{ \left(\frac{e^{-h} - 1}{-h} \right) \right\} \times (-1)$$

$$= -e^{-x}$$

$$\left[\text{Since, } \lim_{h \rightarrow 0} \frac{e^h - 1}{h} = 1 \right]$$

So,

$$\frac{d}{dx}(e^{-x}) = -e^{-x}$$

Question 2.

Solution:

Consider

$$f(x) = e^{3x}$$

$$\Rightarrow f(x+h) = e^{3(x+h)}$$

$$\begin{aligned}
 \frac{d}{dx}(f(x)) &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \\
 &= \lim_{h \rightarrow 0} \frac{e^{3(x+h)} - e^{3x}}{h} \\
 &= \lim_{h \rightarrow 0} \frac{e^{3x} e^{3h} - e^{3x}}{h} \\
 &= \lim_{h \rightarrow 0} e^{3x} \left\{ \left(e^{\frac{3h-1}{3h}} \right) \right\} \times 3
 \end{aligned}$$

$$3e^{3x}$$

So,

$$\frac{d}{dx}(e^{3x}) = 3e^{3x}$$

Question 3.

Solution:

Consider

$$\begin{aligned}
 f(x) &= e^{ax+b} \\
 \Rightarrow f(x+h) &= e^{a(x+h)+b}
 \end{aligned}$$

$$\begin{aligned}
 \frac{d}{dx}(f(x)) &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \\
 &= \lim_{h \rightarrow 0} \frac{e^{a(x+h)+b} - e^{ax+b}}{h}
 \end{aligned}$$

$$= \lim_{h \rightarrow 0} \frac{e^{ax+b} e^{ah} - e^{ax+b}}{h}$$

$$= \lim_{h \rightarrow 0} e^{ax+b} \left\{ \left(e^{\frac{ah-1}{ah}} \right) \right\} \times a$$

$$ae^{ax+b}$$

So,

$$\frac{d}{dx}(e^{ax+b}) = ae^{ax+b}$$

Question 4.**Solution:**

Consider $f(x) = e^{\sqrt{2x}}$

$$f(x+h) = e^{\sqrt{2(x+h)}}$$

$$\frac{d}{dx}(f(x)) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{e^{\sqrt{2(x+h)}} - e^{\sqrt{2x}}}{h}$$

$$= e^{\sqrt{2x}} \lim_{h \rightarrow 0} \left(\frac{e^{\sqrt{2(x+h)} - \sqrt{2x}} - 1}{\sqrt{2(x+h)} - \sqrt{2x}} \right) \left(\sqrt{2 \frac{(x+h) - x}{h}} \right)$$

$$= e^{\sqrt{2x}} \lim_{h \rightarrow 0} \frac{\sqrt{2(x+h)} - \sqrt{2x}}{h} \times \frac{\sqrt{2(x+h)} + \sqrt{2x}}{\sqrt{2(x+h)} + \sqrt{2x}}$$

$$= e^{\sqrt{2x}} \lim_{h \rightarrow 0} \frac{2(x+h) - 2x}{h(\sqrt{2(x+h)} + \sqrt{2x})}$$

$$= e^{\sqrt{2x}} \lim_{h \rightarrow 0} \frac{2h}{h(\sqrt{2(x+h)} + \sqrt{2x})}$$

$$= e^{\sqrt{2x}} \lim_{h \rightarrow 0} \frac{2}{(\sqrt{2(x+h)} + \sqrt{2x})}$$

So,

$$\frac{d}{dx}(e^{\sqrt{2x}}) = \frac{e^{\sqrt{2x}}}{\sqrt{2x}}$$

Q.6**Solution:**

Consider $f(x) = \log \cos x$

$$\Rightarrow f(x+h) = \log \cos(x+h)$$

$$\begin{aligned}
 \frac{d}{dx}(f(x)) &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \\
 &= \lim_{h \rightarrow 0} \frac{\log \cos(x+h) - \log \cos x}{h} \\
 &= \lim_{h \rightarrow 0} \frac{\log \frac{\cos(x+h)}{\cos x}}{h} \\
 &\left[\text{Since, } \log A - \log B = \log \frac{A}{B} \right]
 \end{aligned}$$

$$\begin{aligned}
 &= \lim_{h \rightarrow 0} \frac{\log \left\{ 1 + \frac{\cos(x+h)}{\cos x} - 1 \right\}}{h} \\
 &= \lim_{h \rightarrow 0} \frac{\log \left\{ 1 + \frac{\cos(x+h)}{\cos x} - 1 \right\}}{\left(\cos \frac{(x+h)}{\cos x} \right) h \times \left(\frac{\cos x}{\cos(x+h) - \cos x} \right)}
 \end{aligned}$$

$$= \lim_{h \rightarrow 0} \frac{\cos(x+h) - \cos x}{\cos x \times h}$$

$$\left[\text{since, } \lim_{x \rightarrow 0} \frac{\log(1+x)}{x} = 1 \right]$$

$$= \lim_{h \rightarrow 0} \frac{-2 \sin \left(\frac{x+h+x}{2} \right) \sin \left(\frac{x+h-x}{2} \right)}{\cos x \times h}$$

$$= \lim_{h \rightarrow 0} \frac{\cos(x+h) - \cos x}{\cos x \times h}$$

$$= \lim_{h \rightarrow 0} \frac{-2 \sin \left(\frac{x+h+x}{2} \right) \sin \left(\frac{x+h-x}{2} \right)}{\cos x \times h}$$

$$= -2 \lim_{h \rightarrow 0} \frac{\sin \left(\frac{2x+h}{2} \right) \times \left(\sin \frac{h}{2} \right)}{2 \cos x \left(\frac{h}{2} \right)}$$

$$= \frac{-2 \sin x}{2 \cos x}$$

$$\left[\text{Since, } \lim_{x \rightarrow 0} \frac{\sin x}{x} = 1 \right]$$

$$= -\tan x$$

$$\text{Hence, the solution is } \boxed{\frac{d}{dx} (\log \cos x) = -\tan x}$$

Question 7.

Solution:

$$f(x) = e^{\sqrt{\cos x}}$$

$$\Rightarrow f(x+h) = e^{\sqrt{\cot(x+h)}}$$

$$\text{Consider, } \frac{d}{dx} (f(x)) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

$$\lim_{h \rightarrow 0} \frac{e^{\sqrt{\cot(x+h) - \sqrt{\cot x}}} - 1}{h}$$

$$= e^{\sqrt{\cot x}} \lim_{h \rightarrow 0} \left(\frac{e^{\sqrt{\cot(x+h) - \sqrt{\cot x}}} - 1}{\sqrt{\cot(x+h) - \sqrt{\cot x}}} \right) \times \left(\frac{\sqrt{\cot(x+h) - \sqrt{\cot x}}}{h} \right)$$

$$= e^{\sqrt{\cot x}} \lim_{h \rightarrow 0} \left(\frac{\sqrt{\cot(x+h) - \sqrt{\cot x}}}{h} \right) \times \frac{\sqrt{\cot(x+h) + \sqrt{\cot x}}}{\sqrt{\cot(x+h) + \sqrt{\cot x}}}$$

$$\left[\text{Since, } \lim_{x \rightarrow 0} \frac{e^x - 1}{x} = 1 \text{ and rationalizing numerator} \right]$$

$$= e^{\sqrt{\cot x}} \lim_{h \rightarrow 0} \frac{\cot(x+h) - \cot x}{h(\sqrt{\cot(x+h) + \sqrt{\cot x}})}$$

$$= e^{\sqrt{\cot x}} \lim_{h \rightarrow 0} \frac{\cot(x+h) \cot x + 1}{h(\sqrt{\cot(x+h) + \sqrt{\cot x}})}$$

$$\begin{aligned}
& \left[\text{Since, } \cot(A - B) = \frac{\cot A \cot B + 1}{\cot A - \cot B} \right] \\
&= e^{\sqrt{\cot x}} \lim_{h \rightarrow 0} \frac{\cot(x+h) \cot x + 1}{\coth x h \left(\sqrt{\cot(x+h)} + \sqrt{\cot x} \right)} \\
&= e^{\sqrt{\cot x}} \lim_{h \rightarrow 0} \frac{(\cot(x+h) \cot x + 1)}{\left(\frac{h}{\tanh} \right) \left(\sqrt{\cot(x+h)} + \sqrt{\cot x} \right)} \\
&= \frac{e^{\sqrt{\cot x}} \times (\cot^2 x + 1)}{2\sqrt{\cot x}} \\
& \left[\text{Since, } \lim_{h \rightarrow 0} \frac{\tan x}{x} = 1 \right] \\
&= \frac{e^{\sqrt{\cot x}} \times \sec^2 x}{2\sqrt{\cot x}} \\
& \left[\text{Since, } (1 + \cot^2 x) = \sec^2 x \right]
\end{aligned}$$

Hence, the solution is

$$\frac{d}{dx} \left(e^{\sqrt{\cot x}} \right) = \frac{e^{\sqrt{\cot x}} \times \sec^2 x}{2\sqrt{\cot x}}$$

Q.7

Solution:

Consider

$$f(x) = x^2 e^x$$

$$\Rightarrow f(x+h) = (x+h)^2 e^{(x+h)}$$

$$\begin{aligned}
\frac{d}{dx} (f(x)) &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \\
&= \lim_{h \rightarrow 0} \frac{(x+h)^2 e^{(x+h)} - x^2 e^x}{h} \\
&= \lim_{h \rightarrow 0} \left(\frac{x^2 e^{(x+h)} - x^2 e^x}{h} + \frac{2xhe^{(x+h)}}{h} + \frac{h^2 e^{(x+h)}}{h} \right)
\end{aligned}$$

$$\begin{aligned}
&= \lim_{h \rightarrow 0} \left(\frac{x^2 e^x (e^{(x+h)-x} - 1)}{h} + 2xe^{(x+h)} + he^{(x+h)} \right) \\
&= \lim_{h \rightarrow 0} \left[x^2 e^x \frac{(e^h - 1)}{h} + 2xe^{(x+h)} + he^{(x+h)} \right] \\
&= x^2 e^2 + 2xe^x + 0 \times e^x \\
&\left[\text{Since, } \lim_{h \rightarrow 0} \frac{e^h - 1}{h} = 1 \right]
\end{aligned}$$

Hence, the solution is $\boxed{\frac{d}{dx}(x^2 e^x) = e^x (x^2 + 2x)}$

Q.7

Solution:

Consider $f(x) = \log \cos ecx$

$\Rightarrow f(x+h) = \log \cos ec(x+h)$

$$\begin{aligned}
\frac{d}{dx}(f(x)) &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \\
&= \lim_{h \rightarrow 0} \frac{\log \cos ec(x+h) - \log \cos ecx}{h} \\
&= \lim_{h \rightarrow 0} \frac{\log \left(\frac{\cos ec(x+h)}{\cos ecx} \right)}{h}
\end{aligned}$$

$$= \lim_{h \rightarrow 0} \frac{\log \left(1 + \left(\frac{\sin x}{\sin(x+h)} - 1 \right) \right)}{h}$$

$$= \lim_{h \rightarrow 0} \left\{ \frac{\log \left(1 + \left(\frac{\sin x - \sin(x+h)}{\sin(x+h)} \right) \right)}{\frac{\sin x - \sin(x+h)}{\sin(x+h)}} \right\} \left\{ \frac{\left(\frac{\sin x - \sin(x+h)}{\sin(x+h)} \right)}{h} \right\}$$

$$= \lim_{h \rightarrow 0} \frac{2 \cos \frac{(x+x+h)}{2} \sin \left(\frac{x-x-h}{2} \right)}{\sin(x+h)h}$$

$$\left[\text{Since, } \lim_{h \rightarrow 0} \frac{\log(1+x)}{x} = 1 \text{ and } \sin A - \sin B = 2 \cos \left(\frac{A+B}{2} \right) \sin \left(\frac{A-B}{2} \right) \right]$$

$$= \lim_{h \rightarrow 0} \frac{2 \cos \left(\frac{2x+h}{2} \right) \left\{ \sin \left(-\frac{h}{2} \right) \right\}}{\sin(x+h)(-2) \left\{ -\frac{h}{2} \right\}}$$

$$\left[\text{Since, } \lim_{x \rightarrow 0} \frac{\sin x}{x} = 1 \right]$$

$$\text{Hence, the solution is } \boxed{\frac{d}{dx}(\log \cos ecx) = -\cot x}$$

Q.7

Solution:

Consider

$$f(x) = \sin^{-1}(2x+3)$$

$$\Rightarrow f(x+h) = \sin^{-1}(2(x+h)+3)$$

$$\Rightarrow f(x+h) = \sin^{-1}(2x+2h+3)$$

$$\frac{d}{dx}(f(x)) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

$$= \frac{\lim_{h \rightarrow 0} \frac{\sin^{-1}(2x+2h+3) - \sin^{-1}(2x+3)}{h}}{\lim_{h \rightarrow 0} \frac{\sin^{-1} \left[(2x+2h+3)\sqrt{1-(2x+3)^2} - (2x+3)\sqrt{1-(2x+2h+3)^2} \right]}{h}}$$

$$\left[\text{Since, } \sin^{-1} x - \sin^{-1} y = \sin^{-1} \left[x\sqrt{1-y^2} - y\sqrt{1-x^2} \right] \right]$$

$$= \frac{\lim_{h \rightarrow 0} \frac{\sin^{-1} z}{z}}{\frac{z}{h}} \times \frac{z}{h}$$

$$\text{Where, } z = (2x+2h+3)\sqrt{1-(2x+3)^2} - (2x+3)\sqrt{1-(2x+2h+3)^2} \text{ and } = \frac{\lim_{h \rightarrow 0} \frac{\sin^{-1} z}{z}}{\frac{z}{h}} = 1$$

$$= \frac{\lim_{h \rightarrow 0} \frac{z}{h}}{\frac{z}{h}}$$

$$= \frac{\lim_{h \rightarrow 0} \frac{(2x+2h+3)\sqrt{1-(2x+3)^2} - (2x+3)\sqrt{1-(2x+2h+3)^2}}{h}}{\frac{z}{h}}$$

$$= \frac{\lim_{h \rightarrow 0} \frac{(2x+2h+3)^2 - (2x+3)^2 - (2x+3)^2(1-(2x+2h+3)^2)}{h \left\{ (2x+2h+3)\sqrt{1-(2x+3)^2} + (2x+3)\sqrt{1-(2x+2h+3)^2} \right\}}}{\frac{z}{h}}$$

[Since, rationalizing numerator]

$$\left[(2x+3)^2 + 4h^2 + 4h(2x+3) \right] \left(1 - (2x+3)^2 \right) - (2x+3)^2$$

$$= \frac{\lim_{h \rightarrow 0} \frac{\left[1 - (2x+3)^2 - 4h^2 - 4h(2x+3) \right]}{h \left\{ (2x+2h+3)\sqrt{1-(2x+3)^2} + (2x+3)\sqrt{1-(2x+2h+3)^2} \right\}}}{\frac{z}{h}}$$

$$= \frac{\lim_{h \rightarrow 0} \frac{\left[(2x+3)^2 + 4h^2 + 4h(2x+3) - (2x+3)^4 - 4h^2(2x+3)^2 - 4h(2x+3)^3 - (2x+3)^2 \right.}{h \left\{ (2x+2h+3)\sqrt{1-(2x+3)^2} + (2x+3)\sqrt{1-(2x+2h+3)^2} \right\}}}{\frac{z}{h}} \left. + (2x+3)^4 + 4h^2(2x+3)^2 + 4h(2x+3)^3 \right]$$

$$= \lim_{h \rightarrow 0} \frac{4h[h + (2x + 3)]}{h \left\{ (2x + 2h + 3) \sqrt{1 - (2x + 3)^2} + (2x + 3) \sqrt{1 - (2x + 2h + 3)^2} \right\}}$$

$$= \frac{4(2x + 3)}{(2x + 3) \sqrt{1 - (2x + 3)^2} + (2x + 3) \sqrt{1 - (2x + 3)^2}}$$

$$= \frac{4(2x + 3)}{2(2x + 3) \sqrt{1 - 2x + 3}}$$

$$= \frac{2}{\sqrt{1 - (2x + 3)^2}}$$

Hence, the solution is $\boxed{\frac{d}{dx}(\sin^{-1}(2x + 3)) = \frac{2}{\sqrt{1 - (2x + 3)^2}}}$

Question 8.

Solution:

Consider

$$f(x) = e^{\cos x}$$

$$\Rightarrow f(x + h) = e^{\cos(x + h)}$$

$$\frac{d}{dx}(f(x)) = \lim_{h \rightarrow 0} \frac{f(x + h) - f(x)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{e^{\cos(x + h)} - e^{\cos x}}{h}$$

$$= \lim_{h \rightarrow 0} e^{\cos x} \left[\frac{e^{\cos(x + h) - \cos x} - 1}{h} \right]$$

$$= \lim_{h \rightarrow 0} e^{\cos x} \left[\frac{e^{\cos(x+h) - \cos x} - 1}{\cos(x+h) - \cos x} \right] \times \frac{\cos(x+h) - \cos x}{h}$$

$$= \lim_{h \rightarrow 0} e^{\cos x} \times \left(\frac{\cos(x+h) - \cos x}{h} \right)$$

$$\left[\text{since, } = \lim_{h \rightarrow 0} \frac{e^x - 1}{x} = 1 \right]$$

$$= \lim_{h \rightarrow 0} e^{\cos x} \times \left(\frac{-2 \sin \frac{(x+h+x)}{2} \times \sin \frac{x+h-x}{2}}{h} \right)$$

$$\left[\text{since, } \cos A - \cos B = -2 \sin \frac{A+B}{2} \sin \frac{A-B}{2} \right]$$

$$= e^{\cos x} = \lim_{h \rightarrow 0} \frac{-2 \sin \left(\frac{2x+h}{2} \right) \times \sin \frac{h}{2}}{h}$$

$$= e^{\cos x} = \lim_{h \rightarrow 0} -2 \sin \left(\frac{2x+h}{2} \right) \times \frac{1}{2}$$

$$\left[\text{since, } = \lim_{h \rightarrow 0} \frac{\sin x}{x} = 1 \right]$$

$$= e^{\cos x} (-\sin x)$$

$$= -\sin x e^{\cos x}$$

So the differentiation is

$$\frac{d}{dx} (e^{\cos x}) = -\sin x e^{\cos x}$$
