# Solutions

## Class 11 Maths

### Chapter 3

#### Ex 3.1

### Functions Ex 3.1 Q1

Function = Let  $A$  and  $B$  be two non-empty sets. A relation  $f$  from  $A$  to  $B$ , i.e., a sub-set of  $A \times B$ , is called a function (or a mapping or a map) from  $A$  to  $B$ , if

- (i) for each  $a \in A$  there exists  $b \in B$  such that  $(a, b) \in f$
- (ii)  $(a, b) \in f$  and  $(a, c) \in f \Rightarrow b = c$

If  $(a, b) \in f$ , then ' $b$ ' is called the image of ' $a$ ' under  $f$

If a function  $f$  is expressed as the set of ordered pairs, the domain  $f$  is the set of all first components of members of  $f$  and the range of  $f$  is the set of second components of members of  $f$ .

### Functions Ex 3.1 Q2

Function = Let  $A$  and  $B$  be two non-empty sets. Then a function ' $f$ ' from set  $A$  to set  $B$  is a rule or method or correspondence which associates elements of set  $A$  to elements of set  $B$  such that:

- (i) all elements of set  $A$  are associated to element in set  $B$ .
- (ii) an element of set  $A$  is associated to a unique element in set  $B$ .

In other words, a function ' $f$ ' from a set  $A$  to set  $B$  associates each element of set  $A$  to a unique element of set  $B$ .

### Functions Ex 3.1 Q3

Function is a type of relation. But in a function no two ordered pairs have the same first element. For eg:  $R_1$  and  $R_2$  are two relations.

Clearly,  $R_1$  is a function, but  $R_2$  is not a function because two ordered pairs  $(1, 2)$  and  $(1, 4)$  have the same first element.

This means every function is a relation but every relation is not a function.

### Functions Ex 3.1 Q4

We have,

$$f(x) = x^2 - 2x - 3$$

Now,

$$\begin{aligned}f(-2) &= (-2)^2 - 2(-2) - 3 \\&= 4 + 4 - 3 \\&= 5\end{aligned}$$

$$\begin{aligned}f(-1) &= (-1)^2 - 2(-1) - 3 \\&= 1 + 2 - 3 \\&= 0\end{aligned}$$

$$\begin{aligned}f(0) &= (-0)^2 - 2 \times 0 - 3 \\&= -3\end{aligned}$$

$$\begin{aligned}f(1) &= (1)^2 - 2 \times 1 - 3 \\&= 1 - 2 - 3 \\&= -4\end{aligned}$$

$$\begin{aligned}f(2) &= (2)^2 - 2 \times 2 - 3 \\&= 4 - 4 - 3 \\&= -3\end{aligned}$$

(a)  $\text{Rang}(f) = \{-4, -3, 0, 5\}$

(b) Clearly, pre-images of 6, -3 and 5 is  $\emptyset$ ,  $\{0, 2\}$ , -2 respectively.

### Functions Ex 3.1 Q5

We have,

$$f(x) = \begin{cases} 3x - 2, & x < 0 \\ 1, & x = 0 \\ 4x + 1, & x > 0 \end{cases}$$

Now,

$$\begin{aligned}f(1) &= 4 \times 1 + 1 = 5, \\f(-1) &= 3 \times (-1) - 2 = -3 - 2 = -5, \\f(0) &= 1,\end{aligned}$$

and,  $f(2) = 4 \times 2 + 1 = 9$

$$\therefore \begin{aligned}f(1) &= 5, & f(-1) &= -5, \\f(0) &= 1, & f(2) &= 9,\end{aligned}$$

### Functions Ex 3.1 Q6

We have,

$$f(x) = x^2 \quad \text{--- (i)}$$

(a) clearly range of  $f = R^+$  (set of all real numbers greater than or equal to zero)

(b) we have,

$$\{x : f(x) = 4\}$$

$$\Rightarrow f(x) = 4 \quad \text{--- (ii)}$$

Using equation (i) and equation (ii), we get

$$x^2 = 4$$

$$\Rightarrow x = \pm 2$$

$$\therefore \{x : f(x) = 4\} = \{-2, 2\}$$

(c)  $\{y : f(y) = -1\}$

$$\Rightarrow f(y) = -1 \quad \text{--- (iii)}$$

Clearly,  $x^2 \neq -1$  or  $x^2 \geq 0$

$$\Rightarrow f(y) \neq -1$$

$$\therefore \{y : f(y) = -1\} = \emptyset$$

### Functions Ex 3.1 Q7

We have,

$$f = R^+ \rightarrow R$$

$$\text{and } f(x) = \log_e x \quad \text{--- (i)}$$

(a) Now,

$$f = R^+ \rightarrow R$$

$\therefore$  the image set of the domain of  $f = R$

(b) Now,

$$\{x : f(x) = -2\}$$

$$\Rightarrow f(x) = -2 \quad \text{--- (ii)}$$

Using equation (i) and equation (ii), we get

$$\log_e x = -2$$

$$\Rightarrow x = e^{-2}$$

$$\therefore \{x : f(x) = -2\} = \{e^{-2}\}$$

(c) Now,

$$f(xy) = \log_e(xy)$$

$$= \log_e x + \log_e y$$

$$= f(x) + f(y)$$

$$\therefore f(xy) = f(x) + f(y)$$

Yes,  $f(xy) = f(x) + f(y)$ .

**CopyKitab**  
Online textbooks, click away

### Functions Ex 3.1 Q8

(a) we have,

$$\{(x, y) : y = 3x, x \in \{1, 2, 3\}, y \in \{3, 6, 9, 12\}\}$$

Putting  $x = 1, 2, 3$  in  $y = 3x$ , we get

$$y = 3, 6, 9 \text{ respectively}$$

$$\therefore R = \{(1, 3), (2, 6), (3, 9)\}$$

Yes, it is a function.

(b) we have,

$$\{(x, y) : y > x + 1, x = 1, 2 \text{ and } y = 2, 4, 6\}$$

Putting  $x = 1, 2$  in  $y > x + 1$ , we get

$$y > 2, y > 3 \text{ respectively.}$$

$$\therefore R = \{(1, 4), (1, 6), (2, 4), (2, 6)\}$$

It is not a function from  $A$  to  $B$  because two ordered pairs in  $R$  have the same first element.

(c) we have,

$$\{(x, y) = x + y = 3, x, y \in \{0, 1, 2, 3\}\}$$

Now,

$$y = 3 - x$$

Putting  $x = 0, 1, 2, 3$ , we get

$$y = 3, 2, 1, 0 \text{ respectively}$$

$$\therefore R = \{(0, 3), (1, 2), (2, 1), (3, 0)\}$$

Yes, this relation is a function.

### Functions Ex 3.1 Q9

We have,

$$f : R \rightarrow R \text{ and } g : c \rightarrow c$$

$$\therefore \text{Domain } (f) = R \text{ and Domain } (g) = c$$

$$\therefore \text{Domain } (f) \neq \text{Domain } (g) = c$$

$\therefore f(x)$  and  $g(x)$  are not equal functions.

### Functions Ex 3.1 Q10

(i) We have,

$$f(x) = x^2$$

Range of  $f(x) = R^+$  (set of all real numbers greater than or equal to zero)

$$= \{x \in R \mid x \geq 0\}$$

(ii) We have,

$$g(x) = \sin x$$

$$\text{Range of } g(x) = \{x \in R : -1 \leq x \leq 1\}$$

(iii) We have,

$$h(x) = x^2 + 1$$

$$\text{Range of } h(x) = \{x \in R : x \geq 1\}$$

### Functions Ex 3.1 Q11

(a) We have,

$$f_1 = \{(1, 1), (2, 11), (3, 1), (4, 15)\}$$

$f_1$  is a function from  $X$  to  $Y$ .

(b) We have,

$$f_2 = \{(1, 1), (2, 7), (3, 5)\}$$

$f_2$  is not a function from  $X$  to  $Y$  because there is an element  $4 \in X$  which is not associated to any element of  $Y$ .

(c) We have,

$$f_3 = \{(1, 5), (2, 9), (3, 1), (4, 5), (2, 11)\}$$

$f_3$  is not a function from  $X$  to  $Y$  because an element  $2 \in X$  is associated to two elements 9 and 11 in  $Y$ .

### Functions Ex 3.1 Q12

We have,

$$f(x) = \text{highest prime factor of } x.$$

$$\therefore 12 = 3 \times 4,$$

$$13 = 13 \times 1,$$

$$14 = 7 \times 2,$$

$$15 = 5 \times 3,$$

$$16 = 2 \times 8,$$

$$17 = 17 \times 1$$

$$\therefore f = \{(12, 3), (13, 13), (14, 7), (15, 5), (16, 2), (17, 17)\}$$

$$\therefore \text{Range}(f) = \{3, 13, 7, 5, 2, 17\}$$

### Functions Ex 3.1 Q13

We know that,

$$\text{if } f : A \rightarrow 13$$

such that  $y \in 3$ . Then,

$$f^{-1}(y) = \{x \in A : f(x) = y\}. \text{ In other words, } f^{-1}(y) \text{ is the set of pre-images of } y.$$

Let  $f^{-1}\{17\} = x$ . Then,  $f(x) = 17$

$$\Rightarrow x^2 + 1 = 17$$

$$\Rightarrow x^2 = 17 - 1 = 16$$

$$\Rightarrow x = \pm 4$$

Let  $f^{-1}\{-3\} = x$ . Then,  $f(x) = -3$

$$\Rightarrow x^2 + 1 = -3$$

$$\Rightarrow x^2 = -3 - 1 = -4$$

$$\Rightarrow x = \sqrt{-4}$$

$$\therefore f^{-1}\{-3\} = \emptyset$$

### Functions Ex 3.1 Q14

We have,

$$A = \{p, q, r, s\} \text{ and } B = \{1, 2, 3\}$$

(a) Now,

$$R_1 = \{(p, 1), (q, 2), (r, 1), (s, 2)\}$$

$R_1$  is a function

(b) Now,

$$R_2 = \{(p, 1), (q, 1), (r, 1), (s, 1)\}$$

$R_2$  is a function

(c) Now,

$$R_3 = \{(p, 1), (q, 2), (p, 2), (s, 3)\}$$

$R_3$  is not a function because an element  $p \in A$  is associated to two elements 1 and 2 in  $B$ .

(d) Now,

$$R_4 = \{(p, 2), (q, 3), (r, 2), (s, 2)\}$$

$R_4$  is a function.

### Functions Ex 3.1 Q15

We have,

$$f(n) = \text{the highest prime factor of } n.$$

Now,

$$9 = 3 \times 3,$$

$$10 = 5 \times 2,$$

$$11 = 11 \times 1,$$

$$12 = 3 \times 4,$$

$$13 = 13 \times 1$$

$$\therefore f = \{(9, 3), (10, 5), (11, 11), (12, 3), (13, 13)\}$$

$$\text{Clearly, range}(f) = \{3, 5, 11, 13\}$$

### Functions Ex 3.1 Q16

We have,

$$f(x) = \begin{cases} x^2, & 0 \leq x \leq 3 \\ 3x, & 3 \leq x \leq 10 \end{cases}$$

$$\text{and, } g(x) = \begin{cases} x^2, & 0 \leq x \leq 2 \\ 3x, & 2 \leq x \leq 10 \end{cases}$$

$$\text{Now, } f(3) = (3)^2 = 9 \text{ and } f(3) = 3 \times 3 = 9$$

$$\text{and, } g(2) = (2)^2 = 4 \text{ and } g(2) = 3 \times 2 = 6$$

We observe that  $f(x)$  takes unique value at each point in its domain  $[0, 10]$ . However  $g(x)$  does not take unique value at each point in its domain  $[0, 10]$ .

Hence,  $g(x)$  is not a function.

### Functions Ex 3.1 Q17

Given  $f(x) = x^2$

$$f(1.1) = 1.21$$

$$f(1) = 1$$

$$\frac{f(1.1) - f(1)}{(1.1) - 1} = \frac{1.21 - 1}{1.1 - 1}$$

$$= \frac{0.21}{0.1}$$

$$= 2.1$$

### Functions Ex 3.1 Q18

$f : X \rightarrow R$  given by  $f(x) = x^3 + 1$

$$f(-1) = (-1)^3 + 1 = -1 + 1 = 0$$

$$f(0) = (0)^3 + 1 = 0 + 1 = 1$$

$$f(3) = (3)^3 + 1 = 27 + 1 = 28$$

$$f(9) = (9)^3 + 1 = 81 + 1 = 82$$

$$f(7) = (7)^3 + 1 = 343 + 1 = 344$$

Set of ordered pairs are  $\{(-1, 0), (0, 1), (3, 28), (9, 82), (7, 344)\}$

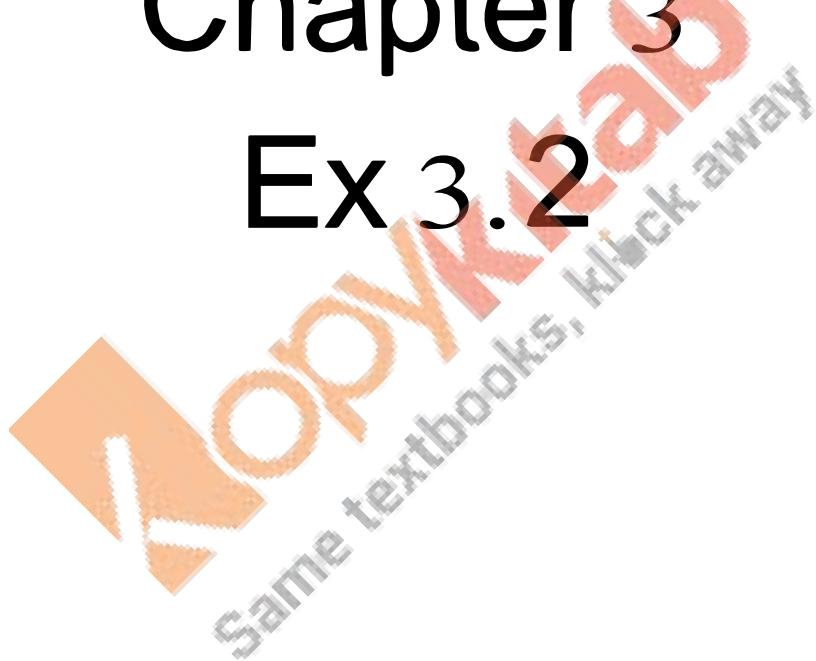

# RD Sharma

## Solutions

### Class 11 Maths

#### Chapter 3

##### Ex 3.2

### Functions Ex 3.1 Q18

$f : X \rightarrow R$  given by  $f(x) = x^3 + 1$

$$f(-1) = (-1)^3 + 1 = -1 + 1 = 0$$

$$f(0) = (0)^3 + 1 = 0 + 1 = 1$$

$$f(3) = (3)^3 + 1 = 27 + 1 = 28$$

$$f(9) = (9)^3 + 1 = 81 + 1 = 82$$

$$f(7) = (7)^3 + 1 = 343 + 1 = 344$$

Set of ordered pairs are  $\{(-1, 0), (0, 1), (3, 28), (9, 82), (7, 344)\}$

### Functions Ex 3.2 Q1

We have,

$$f(x) = x^2 - 3x + 4$$

Now,

$$\begin{aligned} f(2x+1) &= (2x+1)^2 - 3(2x+1) + 4 \\ &= 4x^2 + 1 + 4x - 6x - 3 + 4 \\ &= 4x^2 - 2x + 2 \end{aligned}$$

It is given that

$$\begin{aligned} f(x) &= f(2x+1) \\ \Rightarrow x^2 - 3x + 4 &= 4x^2 - 2x + 2 \\ \Rightarrow 0 &= 4x^2 - x^2 - 2x + 3x + 2 - 4 \\ \Rightarrow 3x^2 + x - 2 &= 0 \\ \Rightarrow 3x^2 + 3x - 2x - 2 &= 0 \\ \Rightarrow 3x(x+1) - 2(x+1) &= 0 \\ \Rightarrow (x+1)(3x-2) &= 0 \\ \Rightarrow x+1 &= 0 \quad \text{or} \quad 3x-2 = 0 \\ \Rightarrow x &= -1 \quad \text{or} \quad x = \frac{2}{3} \end{aligned}$$

### Functions Ex 3.2 Q2

We have,

$$f(x) = (x-a)^2(x-b)^2$$

Now,

$$\begin{aligned} f(a+b) &= (a+b-a)^2(a+b-b)^2 \\ &= b^2a^2 \\ \Rightarrow f(a+b) &= a^2b^2 \end{aligned}$$

### Functions Ex 3.2 Q3

We have,

$$\begin{aligned} y = f(x) &= \frac{ax-b}{bx-a} \\ \Rightarrow y &= \frac{ax-b}{bx-a} \\ \Rightarrow y(bx-a) &= ax-b \\ \Rightarrow xyb - ay &= ax - b \\ \Rightarrow xyb - ax &= ay - b \\ \Rightarrow x(by - a) &= ay - b \\ \Rightarrow x &= \frac{ay-b}{by-a} \\ \Rightarrow x &= f(y) \end{aligned}$$

Hence, proved

### Functions Ex 3.2 Q4

We have,

$$f(x) = \frac{1}{1-x}$$

Now,

$$\begin{aligned} f\{f(x)\} &= f\left\{\frac{1}{1-x}\right\} \\ &= \frac{1}{1-\frac{1}{1-x}} \\ &= \frac{1}{\frac{1-x-1}{1-x}} \\ &= \frac{1-x}{-x} \\ &= \frac{x-1}{x} \end{aligned}$$

$$\begin{aligned} \therefore f[f(x)] &= f\left\{\frac{x-1}{x}\right\} \\ &= \frac{1}{1-\left(\frac{x-1}{x}\right)} \\ &= \frac{1}{\frac{x-x+1}{x}} \\ &= \frac{x}{1} \\ &= x \end{aligned}$$

$$\therefore f[f(x)] = x \text{ Hence, proved.}$$

### Functions Ex 3.2 Q5

We have,

$$f(x) = \frac{x+1}{x-1}$$

Now,

$$\begin{aligned} f[f(x)] &= f\left(\frac{x+1}{x-1}\right) \\ &= \frac{\left(\frac{x+1}{x-1}\right)+1}{\left(\frac{x+1}{x-1}\right)-1} \\ &= \frac{\frac{x+1+x-1}{x-1}}{\frac{x+1-1(x-1)}{x-1}} \\ &= \frac{\frac{2x}{x-1}}{\frac{x+1-x+1}{x-1}} \\ &= \frac{2x}{2} \\ &= x \end{aligned}$$

$$\therefore f[f(x)] = x \text{ Hence, proved.}$$

### Functions Ex 3.2 Q6

We have,

$$f(x) = \begin{cases} x^2, & \text{when } x < 0 \\ x, & \text{when } 0 \leq x < 1 \\ \frac{1}{x}, & \text{when } x \geq 1 \end{cases}$$

$$(a) f(1/2) = \frac{1}{2}$$

$$(b) f(-2) = (-2)^2 = 4$$

$$(c) f(1) = \frac{1}{1} = 1$$

(d)  $f(\sqrt{3}) = \frac{1}{\sqrt{3}}$

(e)  $f(\sqrt{-3})$  does not exist because  $\sqrt{-3} \notin \text{domain}(f)$ .

### Functions Ex 3.2 Q7

We have,

$$f(x) = x^3 - \frac{1}{x^3} \quad \text{---(i)}$$

Now,

$$f\left(\frac{1}{x}\right) = \left(\frac{1}{x}\right)^3 - \frac{1}{\left(\frac{1}{x}\right)^3}$$

$$= \frac{1}{x^3} - \frac{1}{\frac{1}{x^3}}$$

$$\Rightarrow f\left(\frac{1}{x}\right) = \frac{1}{x^3} - x^3 \quad \text{---(ii)}$$

Adding equation (i) and equation (ii), we get

$$\begin{aligned} f(x) + f\left(\frac{1}{x}\right) &= \left(x^3 - \frac{1}{x^3}\right) + \left(\frac{1}{x^3} - x^3\right) \\ &= x^3 - \frac{1}{x^3} + \frac{1}{x^3} - x^3 \\ &= 0 \end{aligned}$$

$$\therefore f(x) + f\left(\frac{1}{x}\right) = 0 \quad \text{Hence, proved.}$$

### Functions Ex 3.2 Q8

We have,

$$f(x) = \frac{2x}{1+x^2}$$

Now,

$$\begin{aligned} f(\tan \theta) &= \frac{2(\tan \theta)}{1+\tan^2 \theta} \\ &= \sin 2\theta \end{aligned}$$

$$\therefore f(\tan \theta) = \sin 2\theta \quad \text{Hence, proved.}$$

### Functions Ex 3.2 Q9

$$\begin{aligned} \text{i. } f(x) &= \frac{x-1}{x+1} \\ f\left(\frac{1}{x}\right) &= \frac{\frac{1}{x}-1}{\frac{1}{x}+1} = \frac{\frac{1-x}{x}}{\frac{1+x}{x}} = \frac{1-x}{1+x} = -f(x) \end{aligned}$$

$$\begin{aligned} \text{ii. } f(x) &= \frac{x-1}{x+1} \\ f\left(-\frac{1}{x}\right) &= \frac{-\frac{1}{x}-1}{-\frac{1}{x}+1} = \frac{\frac{-1-x}{x}}{\frac{-1+x}{x}} = \frac{-1-x}{-1+x} = -\frac{1}{1+x} = -\frac{1}{x-1} = -f(x) \end{aligned}$$

### Functions Ex 3.2 Q10

We have,

$$f(x) = (a-x^n)^{1/n}, \quad a > 0$$

Now,

$$\begin{aligned} f(f(x)) &= f(a-x^n)^{1/n} \\ &= \left[ a - \left\{ (a-x^n)^{1/n} \right\}^n \right]^{1/n} \\ &= \left[ a - (a-x^n) \right]^{1/n} \\ &= [a - a + x^n]^{1/n} \end{aligned}$$

$$\begin{aligned}
 &= [x^n]^{1/n} \\
 &= (x^n)^{n \times \frac{1}{n}} \\
 &= x
 \end{aligned}$$

$$\therefore f(f(x)) = x \quad \text{Hence, proved.}$$

### Functions Ex 3.2 Q11

We have,

$$\begin{aligned}
 &af(x) + bf\left(\frac{1}{x}\right) = \frac{1}{x} - 5 \quad \text{--- (i)} \\
 \Rightarrow \quad &af\left(\frac{1}{x}\right) + bf(x) = \frac{1}{x} - 5 \\
 &\quad \frac{1}{x} \\
 &\quad = x - 5 \\
 \Rightarrow \quad &af\left(\frac{1}{x}\right) + bf(x) = x - 5 \quad \text{--- (ii)}
 \end{aligned}$$

Adding equations (i) and (ii), we get

$$\begin{aligned}
 &af(x) + bf(x) + bf\left(\frac{1}{x}\right) + af\left(\frac{1}{x}\right) = \frac{1}{x} - 5 + x - 5 \\
 \Rightarrow \quad &(a+b)f(x) + f\left(\frac{1}{x}\right)(a+b) = \frac{1}{x} + x - 10 \\
 \Rightarrow \quad &f(x) + f\left(\frac{1}{x}\right) = \frac{1}{a+b} \left[ \frac{1}{x} + x - 10 \right] \quad \text{--- (iii)}
 \end{aligned}$$

Subtracting equation (ii) from equation (i), we get

$$\begin{aligned}
 &af(x) - bf(x) + bf\left(\frac{1}{x}\right) - af\left(\frac{1}{x}\right) = \frac{1}{x} - 5 - x + 5 \\
 \Rightarrow \quad &(a-b)f(x) - f\left(\frac{1}{x}\right)(a-b) = \frac{1}{x} - x \\
 \Rightarrow \quad &f(x) - f\left(\frac{1}{x}\right) = \frac{1}{a-b} \left[ \frac{1}{x} - x \right]
 \end{aligned}$$

Adding equations (iii) and (iv), we get

$$\begin{aligned}
 &2f(x) = \frac{1}{a+b} \left[ \frac{1}{x} + x - 10 \right] + \frac{1}{a-b} \left[ \frac{1}{x} - x \right] \\
 \Rightarrow \quad &2f(x) = \frac{(a-b) \left[ \frac{1}{x} + x - 10 \right] + (a+b) \left[ \frac{1}{x} - x \right]}{(a+b)(a-b)} \\
 \Rightarrow \quad &2f(x) = \frac{\frac{a}{x} + ax - 10a - \frac{b}{x} - bx + 10b + \frac{a}{x} - ax + \frac{b}{x} - bx}{a^2 - b^2} \\
 \Rightarrow \quad &2f(x) = \frac{\frac{2a}{x} - 10a + 10b - 2bx}{a^2 - b^2} \\
 \Rightarrow \quad &f(x) = \frac{1}{a^2 - b^2} \times \frac{1}{2} \left[ \frac{2a}{x} - 10a + 10b - 2bx \right] \\
 &\quad = \frac{1}{a^2 - b^2} \left[ \frac{a}{x} - 5a + 5b - bx \right]
 \end{aligned}$$

$$\begin{aligned}
 &f(x) = \frac{1}{a^2 - b^2} \left[ \frac{a}{x} - bx - 5a + 5b \right] \\
 &= \frac{1}{a^2 - b^2} \left[ \frac{a}{x} - bx \right] - \frac{5(a-b)}{a^2 - b^2} \\
 &= \frac{1}{a^2 - b^2} \left[ \frac{a}{x} - bx \right] - \frac{5(a-b)}{(a-b)(a+b)} \\
 &= \frac{1}{a^2 - b^2} \left[ \frac{a}{x} - bx \right] - \frac{5}{a+b}
 \end{aligned}$$

## Solutions

### Class 11 Maths

#### Chapter 3

##### Ex 3.3

## Functions Ex 3.3 Q1

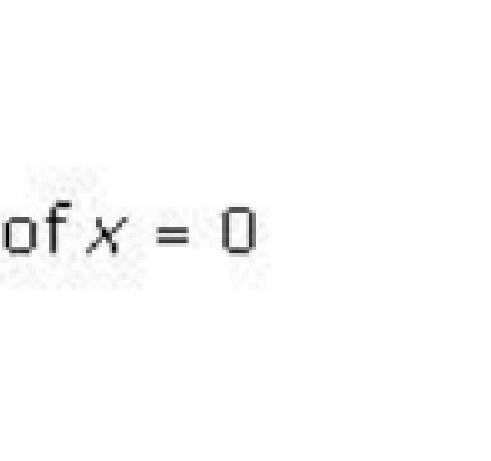

We have,

$$f(x) = \frac{1}{x}$$

Clearly,  $f(x)$  assumes real values for all real values for all  $x$  except for the values of  $x = 0$

Hence, Domain( $f$ ) =  $\mathbb{R} - \{0\}$

---

We have,

$$f(x) = \frac{1}{x-7}$$

Clearly,  $f(x)$  assumes real values for all real values for all  $x$  except for the values of  $x$  satisfying  $x-7=0$  i.e.,  $x=7$

Hence, Domain( $f$ ) =  $R - \{7\}$

We have,

$$f(x) = \frac{3x-2}{x+1}$$

We observe that  $f(x)$  is a rational function of  $x$  as  $\frac{3x-2}{x+1}$  is a rational expression.

Clearly,  $f(x)$  assumes real values for all  $x$  except for the values of  $x$  for which

$x+1=0$  i.e.,  $x=-1$

Hence, Domain =  $R - \{-1\}$

We have,

$$\begin{aligned} f(x) &= \frac{2x+1}{x^2-9} \\ &= \frac{2x+1}{(x^2-3^2)} \\ &= \frac{2x+1}{(x-3)(x+3)} \quad [\because a^2 - b^2 = (a-b)(a+b)] \end{aligned}$$

We observe that  $f(x)$  is a rational function of  $x$  as  $\frac{2x+1}{x^2-9}$  is a rational expression.

Clearly,  $f(x)$  assumes real values for all  $x$  except for all those values of  $x$  for which

$x^2-9=0$  i.e.,  $x=-3, 3$

Hence, Domain( $f$ ) =  $R - \{-3, 3\}$ .

We have,

$$\begin{aligned} f(x) &= \frac{x^2+2x+1}{x^2-8x+12} \\ &= \frac{x^2+2x+1}{x^2-6x-2x+12} \\ &= \frac{x^2+2x+1}{x(x-6)-2(x-6)} \\ &= \frac{x^2+2x+1}{(x-6)(x-2)} \end{aligned}$$

Clearly,  $f(x)$  is a rational function of  $x$  as  $\frac{x^2+2x+1}{x^2-8x+12}$  is a rational expression in  $x$ .

We observe that  $f(x)$  assumes real values for all  $x$  except for all those values of  $x$  for which  $x^2-8x+12=0$  i.e.,  $x=2, 6$

$\therefore$  Domain( $f$ ) =  $R - \{2, 6\}$

## Functions Ex 3.3 Q2

(i) We have,

$$f(x) = \sqrt{x-2}$$

Clearly,  $f(x)$  assumes real values, if

$$x-2 \geq 0$$

$$\Rightarrow x \geq 2$$

$$\Rightarrow x \in [2, \infty)$$

Hence, Domain( $f$ ) =  $[2, \infty]$

(ii) We have,

$$f(x) = \frac{1}{\sqrt{x^2-1}}$$

Clearly,  $f(x)$  assumes real values, if

$$x^2-1 > 0$$

$$\Rightarrow (x-1)(x+1) > 0 \quad [\because a^2 - b^2 = (a-b)(a+b)]$$

$$\Rightarrow x < -1 \text{ or } x > 1$$

$$\Rightarrow x \in (-\infty, -1) \cup (1, \infty)$$

Hence, domain( $f$ ) =  $(-\infty, -1) \cup (1, \infty)$

(iii) We have,

$$f(x) = \sqrt{9 - x^2}$$

Clearly,  $f(x)$  assumes real values, if

$$\begin{aligned} 9 - x^2 &\geq 0 \\ \Rightarrow \quad 9 &\geq x^2 \\ \Rightarrow \quad x^2 &\leq 9 \\ \Rightarrow \quad -3 \leq x &\leq 3 \\ \Rightarrow \quad x &\in [-3, 3] \end{aligned}$$

Hence, domain( $f$ ) =  $[-3, 3]$

(iv) We have,

$$f(x) = \sqrt{\frac{x-2}{3-x}}$$

Clearly,  $f(x)$  assumes real values, if

$$\begin{aligned} x-2 &\geq 0 \quad \text{and} \quad 3-x > 0 \\ \Rightarrow \quad x &\geq 2 \quad \text{and} \quad 3 > x \\ \Rightarrow \quad x &\in [2, 3] \end{aligned}$$

Hence, domain( $f$ ) =  $[2, 3]$ .

### Functions Ex 3.3 Q3

We have,

$$f(x) = \frac{ax+b}{bx-a}$$

We observe that  $f(x)$  is a rational function of  $x$  as  $\frac{ax+b}{bx-a}$  is a rational expression.

Clearly,  $f(x)$  assumes real values for all  $x$  except for the values of  $x$  for which

$$bx-a=0 \text{ i.e., } bx=a$$

$$\Rightarrow \quad x = \frac{a}{b}$$

$$\therefore \text{Domain}(f) = R - \left\{ \frac{a}{b} \right\}$$

Range of  $f$ : Let  $f(x) = y$

$$\begin{aligned} \Rightarrow \quad \frac{ax+b}{bx-a} &= y \\ \Rightarrow \quad ax+b &= y(bx-a) \\ \Rightarrow \quad ax+b &= bxy - ay \\ \Rightarrow \quad b+ay &= bxy - ax \\ \Rightarrow \quad b+ay &= x(by-a) \\ \Rightarrow \quad \frac{b+ay}{b-ay} &= x \\ \Rightarrow \quad x &= \frac{b+ay}{by-a} \end{aligned}$$

Clearly,  $x$  will take real value for all  $x \in R$  except for

$$by-a=0$$

$$\Rightarrow \quad by = a$$

$$\Rightarrow \quad y = \frac{a}{b}$$

$$\therefore \text{Range}(f) = R - \left\{ \frac{a}{b} \right\}.$$

We have,

$$f(x) = \frac{ax-b}{cx-d}$$

We observe that  $f(x)$  is a rational function of  $x$  as  $\frac{ax-b}{cx-d}$  is a rational expression.

Clearly,  $f(x)$  assumes real values for all  $x$  except for all those values of  $x$  for which

$$cx-d=0 \text{ i.e., } cx=d$$

$$\Rightarrow \quad x = \frac{d}{c}$$

$$\therefore \text{Domain}(f) = R - \left\{ \frac{d}{c} \right\}$$

Range: Let  $f(x) = y$

$$\begin{aligned}\Rightarrow \frac{ax - b}{cx - d} &= y \\ \Rightarrow ax - b &= y(cx - d) \\ \Rightarrow ax - b &= cxy - dy \\ \Rightarrow dy - b &= x(cy - a) \\ \Rightarrow \frac{dy - b}{cy - a} &= x\end{aligned}$$

Clearly,  $x$  assumes real values for all  $y$  except

$$cy - a = 0 \text{ i.e., } y = \frac{a}{c}$$

Hence, range( $f$ ) =  $R - \left\{\frac{a}{c}\right\}$

We have,

$$f(x) = \sqrt{x-1}$$

Clearly,  $f(x)$  assumes real values, if

$$x - 1 \geq 0$$

$$\Rightarrow x \geq 1$$

$$\Rightarrow x \in [1, \infty)$$

Hence, domain( $f$ ) =  $[1, \infty)$

Range: For  $x \geq 1$ , we have,

$$x - 1 \geq 0$$

$$\Rightarrow \sqrt{x-1} \geq 0$$

$$\Rightarrow f(x) \geq 0$$

Thus,  $f(x)$  takes all real values greater than zero.

Hence, range( $f$ ) =  $[0, \infty)$

We have,

$$f(x) = \sqrt{x-3}$$

Clearly,  $f(x)$  assumes real values, if

$$x - 3 \geq 0$$

$$\Rightarrow x \geq 3$$

$$\Rightarrow x \in [3, \infty)$$

Hence, domain( $f$ ) =  $[3, \infty)$

Range: For  $x \geq 3$ , we have,

$$x - 3 \geq 0$$

$$\Rightarrow \sqrt{x-3} \geq 0$$

$$\Rightarrow f(x) \geq 3$$

Thus,  $f(x)$  takes all real values greater than zero.

Hence, range( $f$ ) =  $[0, \infty)$

We have,

$$f(x) = \frac{x-2}{2-x}$$

Domain of  $f$ : Clearly,  $f(x)$  is defined for all  $x \in R$  except for which

$$2-x \neq 0 \text{ i.e., } x \neq 2$$

Hence, domain( $f$ ) =  $R - \{2\}$

Range of  $f$ : Let  $f(x) = y$

$$\Rightarrow \frac{x-2}{2-x} = y$$

$$\Rightarrow \frac{-1(2-x)}{2-x} = y$$

$$\Rightarrow -1 = y$$

$$\Rightarrow y = -1$$

$$\therefore \text{Range}(f) = \{-1\}$$

We have,

$$f(x) = |x-1|$$

Clearly,  $f(x)$  is defined for all  $x \in R$

QUESTION: If  $f(x) = \sqrt{|x-1|}$  then domain and range is

$$\Rightarrow \text{Domain}(f) = \mathbb{R}$$

Range: Let  $f(x) = y$

$$\Rightarrow |x-1| = y$$

$$\Rightarrow f(x) \geq 0 \quad \forall x \in \mathbb{R}$$

It follows from the above relation that  $y$  takes all real values greater or equal to zero.

$$\therefore \text{Range}(f) = [0, \infty)$$

As  $|x|$  is defined for all real numbers, its domain is  $\mathbb{R}$  and range is only non-negative numbers because,  $|x|$  is always positive real number for all real numbers and  $-|x|$  is always negative real numbers.

In order to have  $F(x)$  has defined value, term inside square root should always be greater than or equal to zero which gives domain as  $-3 \leq x \leq 3$

Where as Range of above function is limited to  $[0, 3]$

### Class 11 Maths

#### Chapter 3

##### Ex 3.4

### Functions Ex 3.4 Q1

We have,

$$f(x) = x^3 + 1 \text{ and } g(x) = x + 1$$

Now,

$$f+g : R \rightarrow R \text{ given by } (f+g)(x) = x^3 + x + 2$$

$$\begin{aligned} f-g : R \rightarrow R \text{ given by } (f-g)(x) &= x^3 + 1 - (x + 1) \\ &= x^3 - x \end{aligned}$$

$$cf : R \rightarrow R \text{ given by } (cf)(x) = c(x^3 + 1)$$

$$\begin{aligned} fg : R \rightarrow R \text{ given by } (fg)(x) &= (x^3 + 1)(x + 1) \\ &= x^4 + x^3 + x + 1 \end{aligned}$$

$$\frac{1}{f} : R - \{-1\} \rightarrow R \text{ given by } \left(\frac{1}{f}\right)(x) = \frac{1}{x^3 + 1}$$

$$\begin{aligned} \frac{f}{g} : R - \{-1\} \rightarrow R \text{ given by } \left(\frac{f}{g}\right)(x) &= \frac{(x+1)(x^2 - x + 1)}{x+1} \\ &= x^2 - x + 1 \end{aligned}$$

We have,

$$f(x) = \sqrt{x-1} \text{ and } g(x) = \sqrt{x+1}$$

Now,

$$f+g : (1, \infty) \rightarrow R \text{ defined by } (f+g)(x) = \sqrt{x-1} + \sqrt{x+1},$$

$$f-g : (1, \infty) \rightarrow R \text{ defined by } (f-g)(x) = \sqrt{x-1} - \sqrt{x+1},$$

$$cf : (1, \infty) \rightarrow R \text{ defined by } (cf)(x) = c\sqrt{x-1},$$

$$\begin{aligned} fg : (1, \infty) \rightarrow R \text{ defined by } (fg)(x) &= (\sqrt{x-1})(\sqrt{x+1}) \\ &= \sqrt{x^2 - 1} \end{aligned}$$

$$\frac{1}{f} : (1, \infty) \rightarrow R \text{ defined by } \left(\frac{1}{f}\right)(x) = \frac{1}{\sqrt{x-1}}$$

$$\frac{f}{g} : (1, \infty) \rightarrow R \text{ defined by } \left(\frac{f}{g}\right)(x) = \frac{\sqrt{x-1}}{\sqrt{x+1}}$$

### Functions Ex 3.4 Q2

We have,

$$f(x) = 2x + 5 \text{ and } g(x) = x^2 + x$$

We observe that  $f(x) = 2x + 5$  is defined for all  $x \in R$ .

So,  $\text{domain}(f) = R$

Clearly  $g(x) = x^2 + x$  is defined for all  $x \in R$

So,  $\text{domain}(g) = R$

$\therefore \text{Domain}(f) \cap \text{Domain}(g) = R$

(i) Clearly,  $(f+g) : R \rightarrow R$  is given by

$$\begin{aligned} (f+g)(x) &= f(x) + g(x) \\ &= 2x + 5 + x^2 + x \\ &= x^2 + 3x + 5 \end{aligned}$$

$$\text{Domain}(f+g) = R$$

(ii) We find that  $f-g : R \rightarrow R$  is defined as

$$\begin{aligned} (f-g)(x) &= f(x) - g(x) \\ &= 2x + 5 - (x^2 + x) \\ &= 2x + 5 - x^2 - x \\ &= -x^2 + x + 5 \end{aligned}$$

$$\text{Domain}(f-g) = R$$

(iii) We find that  $fg : R \rightarrow R$  is given by

$$\begin{aligned} (fg)(x) &= f(x) \times g(x) \\ &= (2x + 5) \times (x^2 + x) \\ &= 2x^3 + 2x^2 + 5x^2 + 5x \\ &= 2x^3 + 7x^2 + 5x \end{aligned}$$

$$\text{Domain}(fg) = R$$

(iv) We have,

$$\begin{aligned} g(x) &= x^2 + x \\ \therefore f(x) = 0 &\Rightarrow x^2 + x = 0 \\ \Rightarrow x(x+1) &= 0 \\ \Rightarrow x = 0 \quad \text{or,} \quad x &= -1 \end{aligned}$$

$$\begin{aligned} \text{So, domain}\left(\frac{f}{g}\right) &= \text{domain}(f) \cap \text{domain}(g) - \{x : g(x) = 0\} \\ &= R - \{-\phi, 0\} \end{aligned}$$

We find that,  $\frac{f}{g} : R - \{-1, 0\} \rightarrow R$  is given by  $\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)} = \frac{2x+5}{x^2+x}$

$$\text{Domain}\left(\frac{f}{g}\right) = R - \{-1, 0\}$$

### Functions Ex 3.4 Q3

We have,

$$f(x) = \begin{cases} -1, & -2 \leq x \leq 0 \\ x-1, & 0 < x \leq 2 \end{cases}$$

Now,

$$f(|x|) = |x| - 1, \text{ where } -2 \leq x \leq 2$$

$$\text{and } |f(x)| = \begin{cases} 1, & -2 \leq x \leq 0 \\ -(x-1), & 0 \leq x \leq 1 \\ (x-1), & 1 \leq x \leq 2 \end{cases}$$

$$\begin{aligned} \therefore g(x) &= f(|x|) + |f(x)| \\ &= \begin{cases} -x, & -2 \leq x \leq 0 \\ 0, & 0 < x < 1 \\ 2(x-1), & 1 \leq x \leq 2 \end{cases} \end{aligned}$$

### Functions Ex 3.4 Q4

We have,

$$f(x) = \sqrt{x+1} \text{ and } g(x) = \sqrt{9-x^2}$$

We observe that  $f(x) = \sqrt{x+1}$  is defined for all  $x \geq -1$

$$\text{So, domain}(f) = [-1, \infty]$$

Clearly,  $g(x) = \sqrt{9-x^2}$  is defined for

$$9-x^2 \geq 0 \Rightarrow x^2-9 \leq 0$$

$$\Rightarrow x^2-3^2 \leq 0$$

$$\Rightarrow (x-3)(x+3) \leq 0$$

$$\Rightarrow x \in [-3, 3]$$

$$\therefore \text{domain}(g) = [-3, 3]$$

Now,

$$\begin{aligned} \text{domain}(f) \cap \text{domain}(g) &= [-1, \infty] \cap [-3, 3] \\ &= [-1, 3] \end{aligned}$$

$f + g : [-1, 3] \rightarrow R$  is given by  $(f + g)(x) = f(x) + g(x) = \sqrt{x+1} + \sqrt{9-x^2}$

We have,

$$f(x) = \sqrt{x+1} \text{ and } g(x) = \sqrt{9-x^2}$$

We observe that  $f(x) = \sqrt{x+1}$  is defined for all  $x \geq -1$

So,  $\text{domain}(f) = [-1, \infty]$

Clearly,  $g(x) = \sqrt{9-x^2}$  is defined for

$$9-x^2 \geq 0 \Rightarrow x^2-9 \leq 0$$

$$\Rightarrow x^2-3^2 \leq 0$$

$$\Rightarrow (x-3)(x+3) \leq 0$$

$$\Rightarrow x \in [-3, 3]$$

$$\therefore \text{domain}(g) = [-3, 3]$$

Now,

$$\begin{aligned} \text{domain}(f) \cap \text{domain}(g) &= [-1, \infty] \cap [-3, 3] \\ &= [-1, 3] \end{aligned}$$

$g - f : [-3, 3] \rightarrow R$  is given by  $(g - f)(x) = g(x) - f(x) = \sqrt{9-x^2} - \sqrt{x+1}$

We have,

$$f(x) = \sqrt{x+1} \text{ and } g(x) = \sqrt{9-x^2}$$

We observe that  $f(x) = \sqrt{x+1}$  is defined for all  $x \geq -1$

So,  $\text{domain}(f) = [-1, \infty)$

Clearly,  $g(x) = \sqrt{9-x^2}$  is defined for

$$9-x^2 \geq 0 \Rightarrow x^2-9 \leq 0$$

$$\Rightarrow x^2-3^2 \leq 0$$

$$\Rightarrow (x-3)(x+3) \leq 0$$

$$\Rightarrow x \in [-3, 3]$$

$$\therefore \text{domain}(g) = [-3, 3]$$

Now,

$$\begin{aligned} \text{domain}(f) \cap \text{domain}(g) &= [-1, \infty) \cap [-3, 3] \\ &= [-1, 3] \end{aligned}$$

$fg : [-3, 3] \rightarrow R$  is given by  $(fg)(x) = f(x) \times g(x) = \sqrt{x+1} \times \sqrt{9-x^2}$

$$= \sqrt{9+9x-x^2-x^3}$$

We have,

$$f(x) = \sqrt{x+1} \text{ and } g(x) = \sqrt{9-x^2}$$

We observe that  $f(x) = \sqrt{x+1}$  is defined for all  $x \geq -1$

So,  $\text{domain}(f) = [-1, \infty)$

Clearly,  $g(x) = \sqrt{9-x^2}$  is defined for

$$9-x^2 \geq 0 \Rightarrow x^2-9 \leq 0$$

$$\Rightarrow x^2-3^2 \leq 0$$

$$\Rightarrow (x-3)(x+3) \leq 0$$

$$\Rightarrow x \in [-3, 3]$$

$$\therefore \text{domain}(g) = [-3, 3]$$

Now,

$$\begin{aligned} \text{domain}(f) \cap \text{domain}(g) &= [-1, \infty) \cap [-3, 3] \\ &= [-1, 3] \end{aligned}$$

We have,  $g(x) = \sqrt{9-x^2}$

$$\therefore 9-x^2 = 0 \Rightarrow x^2-9 = 0$$

$$\Rightarrow (x-3)(x+3) = 0$$

$$\Rightarrow x = \pm 3$$

$$\text{So, } \text{domain}\left(\frac{f}{g}\right) = [-1, 3] - [-3, 3] = [-1, 3]$$

$$\therefore \frac{f}{g} : [-1, 3] \rightarrow R \text{ is given by } \left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)} = \frac{\sqrt{x+1}}{\sqrt{9-x^2}}$$

We have,

$$f(x) = \sqrt{x+1} \text{ and } g(x) = \sqrt{9-x^2}$$

We observe that  $f(x) = \sqrt{x+1}$  is defined for all  $x \geq -1$

So, domain( $f$ ) =  $[-1, \infty]$

Clearly,  $g(x) = \sqrt{9-x^2}$  is defined for

$$9-x^2 \geq 0 \Rightarrow x^2-9 \leq 0$$

$$\Rightarrow x^2-3^2 \leq 0$$

$$\Rightarrow (x-3)(x+3) \leq 0$$

$$\Rightarrow x \in [-3, 3]$$

$$\therefore \text{domain}(g) = [-3, 3]$$

Now,

$$\begin{aligned} \text{domain}(f) \cap \text{domain}(g) &= [-1, \infty] \cap [-3, 3] \\ &= [-1, 3] \end{aligned}$$

We have,

$$f(x) = \sqrt{x+1}$$

$$\therefore \sqrt{x+1} = 0$$

$$\Rightarrow x+1 = 0$$

$$\Rightarrow x = -1$$

$$\begin{aligned} \text{So, domain}\left(\frac{g}{f}\right) &= [-1, 3] - \{-1\} \\ &= [-1, 3] \end{aligned}$$

$$\therefore \frac{g}{f} : [-1, 3] \rightarrow R \text{ is given by } \frac{g}{f}(x) = \frac{g(x)}{f(x)} = \frac{\sqrt{9-x^2}}{\sqrt{x+1}}$$

We have,

$$f(x) = \sqrt{x+1} \text{ and } g(x) = \sqrt{9-x^2}$$

We observe that  $f(x) = \sqrt{x+1}$  is defined for all  $x \geq -1$

So, domain( $f$ ) =  $[-1, \infty]$

Clearly,  $g(x) = \sqrt{9-x^2}$  is defined for

$$9-x^2 \geq 0 \Rightarrow x^2-9 \leq 0$$

$$\Rightarrow x^2-3^2 \leq 0$$

$$\Rightarrow (x-3)(x+3) \leq 0$$

$$\Rightarrow x \in [-3, 3]$$

$$\therefore \text{domain}(g) = [-3, 3]$$

Now,

$$\begin{aligned} \text{domain}(f) \cap \text{domain}(g) &= [-1, \infty] \cap [-3, 3] \\ &= [-1, 3] \end{aligned}$$

$$2f - \sqrt{5}g : [-3, 3] \rightarrow R \text{ defined by } \begin{aligned} (2f - \sqrt{5}g)(x) &= 2\sqrt{x+1} - \sqrt{5}\sqrt{9-x^2} \\ &= 2\sqrt{x+1} - \sqrt{45-5x^2}. \end{aligned}$$

We have,

$$f(x) = \sqrt{x+1} \text{ and } g(x) = \sqrt{9-x^2}$$

We observe that  $f(x) = \sqrt{x+1}$  is defined for all  $x \geq -1$

So, domain( $f$ ) =  $[-1, \infty]$

Clearly,  $g(x) = \sqrt{9-x^2}$  is defined for

$$9-x^2 \geq 0 \Rightarrow x^2-9 \leq 0$$

$$\Rightarrow x^2-3^2 \leq 0$$

$$\Rightarrow (x-3)(x+3) \leq 0$$

$$\Rightarrow x \in [-3, 3]$$

$$\therefore \text{domain}(g) = [-3, 3]$$

Now,

$$\begin{aligned} \text{domain}(f) \cap \text{domain}(g) &= [-1, \infty] \cap [-3, 3] \\ &= [-1, 3] \end{aligned}$$

$$f^2 + 7f : [-1, \infty] \rightarrow R \text{ defined by } (f^2 + 7f)(x) = f^2(x) + 7f(x)$$

$$[\because D(f) = [-1, \infty]]$$

$$\begin{aligned}
 &= (\sqrt{x+1})^2 + 7\sqrt{x+1} \\
 &= x+1+7\sqrt{x+1}
 \end{aligned}$$

We have,

$$f(x) = \sqrt{x+1} \text{ and } g(x) = \sqrt{9-x^2}$$

We observe that  $f(x) = \sqrt{x+1}$  is defined for all  $x \geq -1$

So, domain( $f$ ) =  $[-1, \infty]$

Clearly,  $g(x) = \sqrt{9-x^2}$  is defined for

$$9-x^2 \geq 0 \Rightarrow x^2-9 \leq 0$$

$$\Rightarrow x^2-3^2 \leq 0$$

$$\Rightarrow (x-3)(x+3) \leq 0$$

$$\Rightarrow x \in [-3, 3]$$

$\therefore$  domain( $g$ ) =  $[-3, 3]$

Now,

$$\begin{aligned}
 \text{domain}(f) \cap \text{domain}(g) &= [-1, \infty] \cap [-3, 3] \\
 &= [-1, 3]
 \end{aligned}$$

We have,

$$g(x) = \sqrt{9-x^2}$$

$$\therefore 9-x^2 = 0 \Rightarrow x^2-9 = 0$$

$$\Rightarrow (x-3)(x+3) = 0$$

$$\Rightarrow x = \pm 3$$

$$\begin{aligned}
 \text{So, domain}\left(\frac{1}{g}\right) &= [-3, 3] - \{-3, 3\} \\
 &= (-3, 3)
 \end{aligned}$$

$$\therefore \frac{5}{g} = (-3, 3) \rightarrow R \text{ defined by } \left(\frac{5}{g}\right)(x) = \frac{5}{\sqrt{9-x^2}}$$

### Functions Ex 3.4 Q5

We have,

$$f(x) = \log_e(1-x)$$

$$\text{and } g(x) = [x]$$

$f(x) = \log_e(1-x)$  is defined, if  $1-x > 0$

$$\Rightarrow 1 > x$$

$$\Rightarrow x < 1$$

$$\Rightarrow x \in (-\infty, 1)$$

$$\therefore \text{Domain}(f) = (-\infty, 1)$$

$g(x) = [x]$  is defined for all  $x \in R$

$$\therefore \text{Domain}(g) = R$$

$$\therefore \text{Domain}(f) \cap \text{Domain}(g) = (-\infty, 1) \cap R$$

$$= (-\infty, 1)$$

$$\begin{aligned}
 \text{(i)} \quad f+g : (-\infty, 1) \rightarrow R \text{ defined by } (f+g)(x) &= f(x) + g(x) \\
 &= \log_e(1-x) + [x]
 \end{aligned}$$

$$\begin{aligned}
 \text{(ii)} \quad fg : (-\infty, 1) \rightarrow R \text{ defined by } (fg)(x) &= f(x) \times g(x) \\
 &= \log_e(1-x) \times [x] \\
 &= [x] \log_e(1-x)
 \end{aligned}$$

$$\text{(iii)} \quad g(x) = [x]$$

$$\therefore [x] = 0$$

$$\Rightarrow x \in (0, 1)$$

$$\begin{aligned}
 \text{So, domain}\left(\frac{f}{g}\right) &= \text{domain}(f) \cap \text{domain}(g) - \{x : g(x) = 0\} \\
 &= (-\infty, 0)
 \end{aligned}$$

$$\therefore \frac{f}{g} : (-\infty, 0) \rightarrow R \text{ defined by } \left(\frac{f}{g}\right)(x) = \frac{\log_e(1-x)}{[x]}$$

(iv) We have,

$$\begin{aligned}
 & f(x) = \log_e(1-x) \\
 \Rightarrow & \frac{1}{f(x)} = \frac{1}{\log_e(1-x)} \\
 \therefore & \frac{1}{f(x)} \text{ is defined if } \log_e(1-x) \text{ is defined and } \log_e(1-x) \neq 0 \\
 \Rightarrow & 1-x > 0 \quad \text{and} \quad 1-x \neq 0 \\
 \Rightarrow & x < 1 \quad \text{and} \quad x \neq 0 \\
 \Rightarrow & x \in (-\infty, 0) \cup (0, 1) \\
 \therefore & \text{domain}\left(\frac{g}{f}\right) = (-\infty, 0) \cup (0, 1)
 \end{aligned}$$

$$\frac{g}{f} : (-\infty, 0) \cup (0, 1) \rightarrow R \text{ defined by } \left(\frac{g}{f}\right)(x) = \frac{[x]}{\log_e(1-x)}$$

Now,

$$\begin{aligned}
 (f+g)(-1) &= f(-1) + g(-1) \\
 &= \log_e(1 - (-1)) + [-1] \\
 &= \log_e 2 - 1
 \end{aligned}$$

$$\Rightarrow (f+g)(-1) = \log_e 2 - 1$$

$$\begin{aligned}
 (\text{v}) \quad fg(0) &= \log_e(1-0) \times [0] \\
 &= 0
 \end{aligned}$$

$$(\text{vi}) \quad \left(\frac{f}{g}\right)\left(\frac{1}{2}\right) = \text{does not exist}$$

$$\begin{aligned}
 (\text{vii}) \quad \left(\frac{g}{f}\right)\left(\frac{1}{2}\right) &= \frac{\left[\frac{1}{2}\right]}{\log_e\left(1 - \frac{1}{2}\right)} = 0
 \end{aligned}$$

### Functions Ex 3.4 Q6

We have,

$$f(x) = \sqrt{x+1}, g(x) = \frac{1}{x}$$

$$\text{and } h(x) = 2x^2 - 3$$

Clearly,  $f(x)$  is defined for  $x+1 \geq 0$

$$\Rightarrow x \geq -1$$

$$\Rightarrow x \in [-1, \infty]$$

$$\therefore \text{Domain}(f) = [-1, \infty]$$

$g(x)$  is defined for  $x \neq 0$

$$\Rightarrow x \in R - \{0\}$$

and,  $h(x)$  is defined for all  $x \in R$

$$\therefore \text{Domain}(f) \cap \text{Domain}(g) \cap \text{Domain}(h) = [-1, \infty] - \{0\}$$

Clearly,

$2f+g-h : [-1, \infty] - \{0\} \rightarrow R$  is given by

$$\begin{aligned}
 (2f+g-h)(x) &= 2f(x) + g(x) - h(x) \\
 &= 2\sqrt{x+1} + \frac{1}{x} - 2x^2 + 3
 \end{aligned}$$

$$\therefore (2f+g-h)(1) = 2\sqrt{1+1} + \frac{1}{1} - 2 \times (1)^2 + 3$$

$$= 2\sqrt{2} + 1 - 2 + 3$$

$$= 2\sqrt{2} + 4 - 2$$

$$= 2\sqrt{2} + 2$$

and,  $(2f+g-h)(0)$  does not exist, it is not lies in the domain  $x \in [-1, \infty] - \{0\}$ .

### Functions Ex 3.4 Q7

Let,

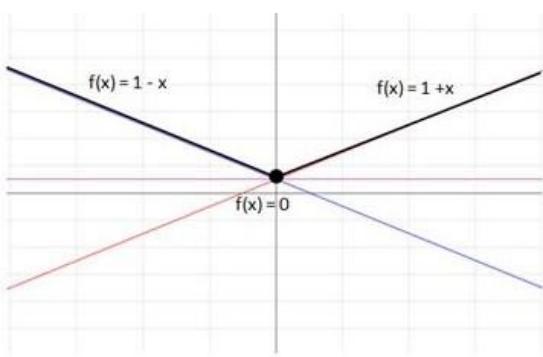

$$y = f(x) = \begin{cases} 1-x, & x < 0 \\ 1, & x = 0 \\ x+1, & x > 0 \end{cases}$$

The graph of  $f(x)$  for  $x < 0$  is the part of the line  $y = 1-x$  that lies to the left of origin.

The graph of  $f(x)$  for  $x > 0$  is the part of the line  $y = 1+x$  that lies to the right of origin.

For  $x = 0$ , the graph of  $f(x)$  represents the point  $(0, 1)$

The graph of  $f(x)$  is shown below.

### Functions Ex 3.4 Q8

$f: R \rightarrow R$  defined by  $(f+g)(x) = 3x - 2$

$f: R \rightarrow R$  defined by  $(f-g)(x) = -x + 4$

$f: R - \left\{ \frac{3}{2} \right\} \rightarrow R$  defined by  $\frac{f}{g}(x) = \frac{x+1}{2x-3}$

### Functions Ex 3.4 Q9

$f+g: [0, \infty) \rightarrow R$  defined by  $(f+g)(x) = \sqrt{x} + x;$

$f-g: [0, \infty) \rightarrow R$  defined by  $(f-g)(x) = \sqrt{x} - x;$

$fg: [0, \infty) \rightarrow R$  defined by  $(fg)(x) = x^{3/2};$

$\frac{f}{g}: [0, \infty) \rightarrow R$  defined by  $\left( \frac{f}{g} \right)(x) = \frac{1}{\sqrt{x}};$

### Functions Ex 3.4 Q10

$(f+g): R \rightarrow [0, \infty)$  defined by  $(f+g)(x) = x^2 + 2x + 1 = (x+1)^2$

$(f-g): R \rightarrow R$  defined by  $(f-g)(x) = x^2 - 2x - 1$

$(fg): R \rightarrow R$  defined by  $(fg)(x) = 2x^3 + x^2$

$\left( \frac{f}{g} \right): R \rightarrow R$  defined by  $\left( \frac{f}{g} \right)(x) = \frac{x^2}{2x+1}$
